

SUPERINTENDING ENGINEER CONTRACTS & MONITORING

Chennai Metropolitan Water supply and Sewerage Board

No.1, Pumping Station Road, Chennai - 600 002 FAX : 044-2845 4336 E-Mail:<u>secandm@gmail.com</u>

Lr. No. CMWSSB/CNT/WSS/NCB/AMRUT-GoTN/400MLD/CP4/012/2024-25 dt 08.04.2025

То

Sir,

Sub: CMWSSB - C&M Wing – Implementation of continuous Water Supply of Pallipattu WDS & Thiruvanmiyur WDS under Area XIII of Chennai City under Hybrid Annuity Model (HAM) – e-Tender invited – Corrigendum - I has been prepared – forwarded - Reg

Ref : Tender No. CNT/WSS/NCB/AMRUT–GoTN/400MLD/CP4/012/2024-25

-000-

With reference to the above work, Corrigendum - I have been prepared and enclosed herewith. You are requested to take these Corrigendum - I into due consideration while submitting your bid. All the other terms and conditions already stipulated remain unaltered.

The bid documents will be available for submission up to 3.00 P.M. on 16.04.2025. The Tender can be uploaded up to 3.00 P.M. on 16.04.2025. The Tender will be opened on 17.04.2025 from 3.30 P.M. onwards.

You are requested to acknowledge the receipt of this letter.

SUPERINTENDING ENGINEER (CONTRACTS & MONITORING)

Encl: 1. Confirmation Letter – Pg. 2

- 2. Corrigendum I Pg.3
 - I. DPR with all Annexures
 - II. GIS Network drawings, hydraulic modelling & other drawing in appropriate (shp or gbd and dwg or dxf) format
 - III. CMWSSB's financial model

<u> Corrigendum - I</u>

Name of Work: Implementation of continuous Water Supply of Pallipattu WDS & Thiruvanmiyur WDS under Area XIII of Chennai City under Hybrid Annuity Model (HAM)

Tender No: CNT/WSS/NCB/AMRUT–GoTN/400MLD/CP4/012/2024-25

-000-

We have taken into due consideration of the Corrigendum - I while submitting our bid.

Signature of the bidder

Name and Address of the bidder

<u> Corrigendum - I</u>

- Name of Work: Implementation of continuous Water Supply of Pallipattu WDS & Thiruvanmiyur WDS under Area XIII of Chennai City under Hybrid Annuity Model (HAM)
- Tender No: CNT/WSS/NCB/AMRUT–GoTN/400MLD/CP4/012/2024-25

EXECUTIVE SUMMARY

1. PROJECT BACKGROUND:

Chennai, formerly known as Madras, is the Capital City of Tamil Nadu State. Located on the Coromandel coast of Bay of Bengal, the city is a major Commercial, Cultural, Economic and Educational Centre in South India. It is also known as the Cultural Capital of South India.

As per the 2011 census, the population of Chennai Core city was 46,46,732, with an area of 176 Sq km. The city has 107 wards/Depots lying within the 7 administrative areas, namely IV, V, VI, VIII, IX, X & XIII. Chennai Metropolitan Water Supply and Sewerage Board ("CMWSSB") is responsible for administration, operation and maintenance of the Chennai City's water production, treatment, storage, distribution, billing and revenue collection. The present water supply system is intermittent due to various constraints in source, storage facilities and inadequacy of the existing distribution system. The Chennai Core city's average per capita water supply is about 101 lpcd against per capita supply norm of 150 lpcd as per CPHEEO manual 2023.

To improve the current water supply situation, CMWSSB has engaged Water Corporation of Odisha (WATCO) to provide Project Management Consulting Services for the work improvement of existing water distribution networks under Area-X and Area-XIII of Chennai City for achieving 24X7 water supply. The contract agreement between CMWSSB and WATCO was signed on 20th July 2023 for a period of forty eight (48) months.

Broad scope of services of WATCO for providing 24X7 water supply to administrative block X & XIII of Chennai Metropolitan Water Supply and Sewerage Board Are:

- i. Survey and investigations.
- ii. Planning and design for converting the existing intermittent water supply to 24 X 7 in all water distribution system of Areas -X and XIII of CMWSSB.
- iii. Preparation of Detailed Project Report (DPR).
- iv. Preparation of technical specifications and tender documents for the work.
- v. Assisting the employer in the bidding process and recommendation of the right bidder for award of the works contract for 24 X 7 sustainable water supply.
- vi. To conduct Environment and Social Impact Assessment (ESIA) and prepare the Environment and Social Management Plan (ESMP).
- vii. Services covering approval of detailed designs, coordination with the contractor, monitoring work, assist in dispute resolution, specialized techno-commercial advice during execution of work for ensuring completion of the work in a time bound manner.
- viii. Assist the employer in commissioning the work.

2. NEED FOR THE PROJECT:

The Water supply in Chennai city, apart from intermittency in supply, water supply in Chennai core city is characterized by irregular and inequitable distribution of drinking water both in terms of quantity and pressure as well as the water quality issues. This is because of the inadequacy in the existing water distribution management infrastructure to run on a demand /supply management regime. Therefore, it is imperative to formulate a proposal to improve the existing distribution system to achieve equitable and sustainable 24 X 7 water supply to all the zones of Chennai core city.

However, administrative areas X and XIII are prioritized based on the CMWSSSB's funding availability.

The **present report comprises of Detailed Project Report for improving water distribution networks containing 7 water supply depots, out of 13 water supply depots, under 2 WDS namely Palipattu and Tiruvanmiyur under admin Area XIII**. The design broadly consists of replacement/strengthening of existing distribution pipes, pumping systems, adequacy check of storage tanks, development of District Metering Areas, instrumentation, control and automation system with smart water management, billing and collection system, 0&M protocol, financial modelling for funding under Hybrid annuity model , project implementation schedules, bid management and PMC services for achieving 24X7 water supply pressurized system ensuring proper efficiency, quality, maintainability, and flexibility for water supply services.

3. CONTENTS:

The Detailed Project Report (DPR) for the Delineated Area under XIII (refer to the project area location map in Fig 1). The DPR comprises of the following Chapters:

- 1- Project Background and scope of services
- 2- Brief Overview of the existing water supply system
- 3- Survey and Investigation
- 4- Design Criteria
- 5- Population projection and water demand assessment
- 6- Design of Proposed Water supply system
- 7- Cost estimates
- 8- Financial Modelling
- 9- Project implementation plan
- 10- Operation and maintenance
- 11- Social and Environmental Impact Assessment

4. PROJECT AREA:

Area XIII covers a total of 13 wards/Depots numbered from 170 to 182. However, the Project Area of the present detailed project report covers Palipattu WDS and Thiruvanmiyur WDS, with 7 depots (6 depots fully covered and 1 depot partially covered, namely Depot No.s 169 (P), 170, 173, 174, 178, 179 and 180. The map showing proposed operational zone boundaries is presented in Figure-1 below.

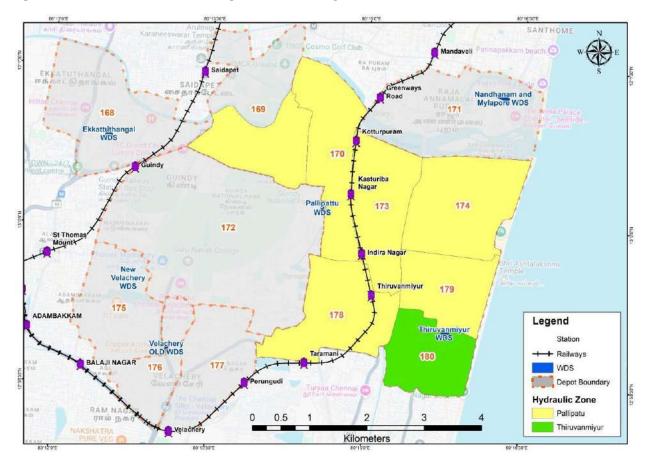

Figure- 1. Map Showing the Proposed Hydraulic Zonal Boundaries of Project Area Under Area XIII

5. PROJECT DESIGN PERIOD:

The project will be commissioned in 2026 (Base year), So, the horizon years are considered as 2041 (as intermediate year) and 2056 (the ultimate year).

6. SURVEY AND INVESTIGATION:

WATCO carried out the following survey and investigation activities. The detailed Findings of the survey & investigation activities have been detailed in Chapter 3

(i) GIS based Asset Survey:

Asset survey has been conducted on site using DGPS survey followed with development of asset survey maps on GIS platform duly validated by the Department. As per the asset survey, the total lengths of the existing pipelines are about 630 km with diameter ranging from 100mm to 1100mm. The CI piping material comprises nearly 81.16% of the total pipe-lengths, while DI and PVC piping material comprises

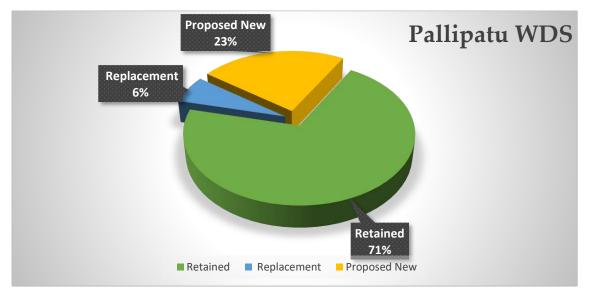

14.88% and 3.93 %, respectively, with 0.03% only MS piping and other materials. The total existing network which would be connected to Pallipatu WDS for distribution of water is 245.69 KM & the network connected from Thiruvanmiyur WDS is 49.79 KM. The total existing distribution considered in this DPR is 295.46 KM.

(ii) GIS Based Consumer Survey:

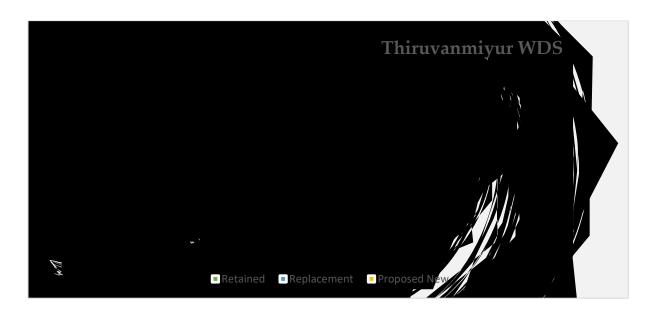

Through door-to-door consumer survey, it is found that, there are about 75618 premises with 136829 households with total population of 644075. Out of the total households, 71242 households receive water supply from CMWSSB, while 3923 households receive water from their own borewells whereas 61585 depend on both CMWSSB supply and own borewell supply.

(iii) Condition Assessment Survey:

Condition assessment survey of pipeline was carried out based on analysis of existing data on frequent breakdown history, low pressure areas, no water areas, water quality deficiency areas, by adopting different technology/methods such as flow measurement using ultrasonic flow meter, conducting on the site Brinell's hardness test, destructive testing and robotic camera inspection of the internal surface of pipeline. Pipeline location identification has been done using GPR method. Study outcomes reveal that overall 7% of existing pipes mainly at tail ends are found to be in deteriorating conditions, requiring replacement, whereas from the robotic test, it has been found that some areas are experiencing low pressure, need flushing due to deposition/incrustation to maintain required capacity/flow. A pictorial pie chart is shown below,

7. EXISTING WATER SUPPLY SYSTEM IN AREA XIII:

7.1. Sources of Water Supply:

Presently, all areas under XIII water distribution stations (WDS) are receiving water mainly from three sources, namely Vadakuthu WTP, Chembarambakkam WTP and Nemmeli DSP. The details of Thiruvanmiyour and Pallipattu WDS under Area XIII with their source connectivity and beneficiary Depots are presented below in Table-3.

Sl.No.	WDS Name	Beneficiary Depots	Sources	
1.	Thiruvanmiyur	173P,174P,178P, 179P, 180P	Nemmeli DSP	
		173P,174P,178P,179P,180		
2	Pallipattu	P,169P,170P	Chembrambakkam &	
			Vadakuthu WTPs and	
			Nemmeli DSP	

Source: As per site information, P- Part of the Depot

Presently, there are no specific hydraulically delineated discrete zones catered by command area based on the storage reservoir's capacity, topographical features or population. There is absence of isolation of Water Distribution Zones (WDZ) further characterized by existence of interconnections between the WDZs, making the system difficult to achieve equitable water distribution with designated pressure

7.2. House Service Connections:

The area XIII has total service connections 93113 nos. of which 2036 nos. (2%) are metered and 91077 nos. (98%) are unmetered.

8. POPULATION PROJECTION-WATER DEMAND OF AREA XIII:

As per the 2011 census, the total population of Chennai core city is 46,46,732, out of which Admin Area -XIII contributes to 5,49,760. Population forecasting has been done by various methods and after deliberation with CMWSSB, the decadal growth method has been adopted with a growth rate of 6.8% per decade. Table 8 and 9 show the projected population and water demand details at the WDS level for the base, intermediate and ultimate years for the admin Area XIII respectively. Domestic water demand has been considered @ 150lpcd, Institutional/Industrial/Commercial demand as per survey data, Fire demand @ $100\sqrt{P}$, floating population @2% of domestic demand i.e. 3lpcd and distribution losses @10% of domestic demand i.e. 15lpcd.

	On and the set Zerra	Population Projection		
Name of the WDS	Operational Zone (Depots) Number	2026 (Base Year)	2041 (Intermediate Year)	2056 (Ultimate Year)
Pallipatu WDS	170, 173, 174, 178, 179, 169(P)	260957	288879	319791
Thiruvanmiyur WDS	180	67215	74407	82368
Total		328172	363286	402159

Table- 8: Population Estimation Details Of WDS And Operational Zones

Table 9: Demand Calculation of WDS And Its Operational Zones

Name of the WDS	Operational Zone (Depots) Number	Demand Calculation (Domestic Demand + Commercial/Institutional Demand + Fire Demand+10% Distribution System losses)		
		2026 (Base Year)	2041 (Intermediate Year)	2056 (Ultimate Year)
Pallipatu WDS	170, 173, 174, 178, 179, 169(P)	39.67	44.12	48.92
Thiruvanmiyur WDS	180	10.34	11.44	12.66
Total		50.01	55.56	61.58

9. PROPOSED WATER SUPPLY INFRASTRUCTURE:

9.1. Proposed Source and it's Sustainability:

It is proposed to use the Nemmeli DSP with a capacity of 100MLD for the water supply to the project area. As presented in Table-9 above, total quantity of water required for

base year (2026) is 50 MLD, for Intermediate year (2041) is 55.56 MLD & for ultimate year (2056) is 61.57 MLD. At present Nemmeli treatment plant is producing 80 MLD which is sufficient to meet the water demand of 50MLD, 55.56MLD and 61.58MLD in the base year (2026), intermediate year (2041) and ultimate year (2056) respectively.

9.2. Transmission Mains:

Transmission mains have been designed for the ultimate design period i.e. for the year 2056. Capacity enhancement by laying additional pipeline is proposed wherever required. However, cost of transmission additional transmission mains system is not covered in the present proposal due to funding constraints.

9.3. Storage Facilities:

The existing storage reservoir capacity of Pallipatu WDS is 17 ML and the requirement of reservoir for the intermediate design year is 11.92 ML and as per CPHHEO guideline, storage reservoir capacity is in excess by 14.35% & as per Mass balancing storage reservoir capacity is in excess by 29.85%

The existing storage reservoir capacity of Thiruvanmiyur WDS is 3 ML and the requirement of reservoir for the intermediate design year is 3.77 ML & as per CPHHEO guideline, reservoir storage capacity is meager by 25.67% & as per Mass balancing, reservoir storage capacity is meager by 3.33%. As the deficit in Mass balancing exercise, it is coming 3.33%, considering space constraints no additional storage is proposed. Details are presented in Table 11 below.

Sto	Storage capacity Details						
Sl.	WDS Name	Present	Required	Required	Storage	Capacity	
No.		Storage	Storage	Storage	Deficit / l	Excess	
			Capacity	Capacity as			
			@ 33%	per mass			
			in MLD	balancing			
				MLD			
		Capacity		041	As per	As per	
		in MLD,	(Interme	ediate Year)	CPHEEO	Mass	
		2023			(33%)	Balancing	
	А	D	F	G	H=D-F	I=D-G	
1	Pallipatu WDS	17	14.56	11.925	2.44	5.075	
2	Thiruvanmiyur (New) WDS	3	3.77	3.1	-0.77	-0.1	

Table-11: Storage Facilities

9.4. Pumping facilities:

Pumps are designed to provide water from WDS to the operational zones. Pumping system consists of six pumps, four working and two stand-by for Pallipatu WDS and

two working and one stand-by for Thiruvanmyur WDS. Details of Pump sets are presented in Chapter-6.

9.5. Hydraulic Zones / Operational Zones:

There are seven operational zones covered in this DPR, out of which six operational zones are supplied by Pallipatu WDS namely OZ-169(P), OZ-170, OZ-173, OZ-174, OZ-178, OZ-179 & one operational zone is supplied by Thiruvanmiyur WDS namely OZ-180, as presented below in Table-13.

	Detail of Proposed No. of Operational Zones			
Sl. No.	Name of the WDS	No. of Operational Zones Proposed	Operational Zone Name	
1	Pallipatu WDS	6	OZ-169(P), OZ-170, OZ-173, OZ-174, OZ-178 & OZ-179	
2	Thiruvanmiyur (New) WDS	1	0Z-180	

Table-13: Operational Zones

10. DMA Demarcation, Hydraulic Modelling for Distribution System:

Each Operational Zone is divided into number of DMAs, considering easiness of operation, control & monitoring of DMAs with number of house connection between 250-1000. Each DMA can be isolated during breakdown without affecting the water supply of other DMAs / areas. 97 DMAs have been proposed under Pallipatu WDS and 28 DMAs under Thiruvanmiyur (New) WDS as presented in Table-14.

	Detail of Proposed No. of DMAs		
Sl. No.	Name of the WDS	No. of DMAs, Proposed	
1	Pallipatu WDS	97	
2	Thiruvanmiyur (New) WDS	28	
	Total	125	

Table-14: Number Of DMAs Under The WDS

10.1. Distribution Network:

As per condition assessment survey of pipelines, in Pallipatu about 20 KM of pipelines of different diameters out of 245.69 KM of pipeline has to be replaced, while 74.75KM of new pipelines are proposed. Similarly, as per condition assessment survey of pipelines, in Thiruvanmiyur (New) WDS about 12.75 KM of pipeline of different diameters out of 49.8KM of pipeline has to be replaced while 5.9KM of new pipeline is proposed.

Details of new pipe proposed and existing pipes retained/replaced are presented in Chapter-6.

10.2. Digital Water Management- Instrumentation, Control & Automation:

To achieve reduced Non revenue Water through real-time data capture, analysis, decision making, the deployment of "Digital Water Management System" is proposed. Some of the unique aspects of the Smart Water Management system includes the following:

- i. Real-time quality surveillance to ensure drink from tap quality water at every home.
- ii. Real-time data analysts and decision making resulting in uninterrupted and consistent water supply service delivery.
- iii. Data capture for preventive maintenance of water supply assets.
- iv. Reduction of non-revenue water through leakage detection and control.
- v. Efficient incidence management and quick resolution of problems.
- vi. Efficient consumer complaint redressal for enhancing consumer satisfaction.

10.3. The following control philosophy and system architecture is proposed.

10.3.1. Instruments within Pump house

- o Butterfly Valve with feedback,
- Vertical Inline pump with motor,
- Pressure Gauge,
- Electromagnetic Flow Meter,
- Motor operating valve,
- Discharge Manifold.

10.3.2. Instrument outside the Pump house:

- Bulk flow meter
- Pressure Transmitter

Pumping system will run on automation through PLC and SCADA system controlled through VFD. The PLC-SCADA system will be connected to the Depot by OFC cables.

10.3.4. Control Unit at DMA entry consists of following instrumentation

- DI Double Flange resilient seated glandless gate valve
- Electro Magnetic Flow Meter
- Double Chamber DI Control valve, Hydraulic Operated 24 V DC, Solenoid control, IP 68, Integrated with PLC panel,
- Pressure Gauge
- Pressure Transmitter

10.3.5. Control Unit at Lane/Sub Lane entry consisting of following instruments:

- o Flow Meter
- Basket Strainer
- o Air Valve
- o Globe Valve

The RTU based instrumentation control system at Lane/Sub- Lane level shall be connected to the PLC panel at DMA level for integration of data for communicating to SCADA-PLC Control Centre at Depot. All communications shall be through Fiber Optic cables laid for the purpose. There shall be DG power backup system at different points as per necessity.

10.3.6. House Service Connections:

House service connection is the most vulnerable point of leakage. To achieve leak proof house connections, all house connections are proposed with saddle and compression fittings. At the Consumer end, a mechanical flow meter shall be installed with an isolation valve.

Proposed House Service Connection consists of following,

- Compression Fitting
- Pipe Material used: MDPE & UPVC
- Ball Valve
- Non-Returning Valve

11. Domestic Water Meters and Bulk Water Meters:

IOT based AMR meters have been proposed connecting to the Billing and collection system at Depot level.

12. PROJECT COST ESTIMATE:

The cost estimate was prepared by taking the rates from the reference documents,

- CMWSSB-SOR-2024-25, Schedule of rates 2024-25
- Govt. of Tamil Nadu
- MJP SoR 2023-24
- RUIDP SoR 2023-24
- Circular dated 10-09-2020, GCC- Greater Chennai Corporation- Bus route road Department

For those items rates which are not available in the SoR, market price has been adopted, after taking 3 nos. of quotations from relevant Suppliers/Manufactures.

13. Project Financial Model:

The project is proposed to be developed in Hybrid Annuity Model (HAM). The capital structure evolved is presented in table-20 below,

Capital Structure	Overall	After excl. grant	INR Crore
Equity	13.33%	33.33%	36.99
Debt	26.74%	66.67%	73.99
Grant-construction	59.9%		165.75
Total	100%		276.73

Source: Consultant's Analysis

The concession period considered is 17 years, overall, which includes 2 years of construction & 15 years of operation period.

The revenue figures are in a modest range from INR 20.0 Crores in the initial year to INR 30.00 Crores in the last year owing to an increase only in operation & maintenance compensation while Capax lined annuity component remains flat.

Project financial returns for the PPP developer are comfortable with a project IRR over 10.29%, equity IRR above 12.28% & DSCR above 1.82.

The detailed financial model and project cashflow is presented in Chapter- 8.

14. Project Implementation Schedule:

The project will be completed within a period of 24 (twenty-four) months.

15. Project O&M:

The O&M period shall be 15 years to be operated and maintained by the HAM developer.

16. Social and Environmental Impact Assessment (SEIA):

SEIA study has been conducted to assess the social and environmental impact during pre-construction, construction, and operation and maintenance period and mitigation measures recommended. There will be an overall positive impact once the project is completed and commissioned, benefiting people of all categories.

CHAPTER -1- PROJECT BACKGROUND AND SCOPE OF SERVICES

1.1 Project Background

Chennai, formerly known as Madras, is the capital city of Tamil Nadu, the southernmost state of India. It is the state's primary city and is located on the Coromandel Coast of the Bay of Bengal. According to the 2011 Indian census, Chennai is the sixth-most populous city in India and forms the fourth-most populous urban agglomeration.

The Greater Chennai Corporation (previously Madras) is the Oldest Municipal Institution in India established in the year 1866. The Madras Municipal Corporation Act, 1919 (as amended) provides the basic Statutory authority for the administration of Chennai corporation. Incorporated in 1866, the Greater Chennai Corporation is the oldest municipal corporation of India and the second oldest in the world after London.

According to 2011 census, the city (Chennai Core City) had a population of 4,646,732, within an area of 176 square kilometers. Post expansion of the city to 426 km², the population including the new city limits as per the 2011 census was 6,748,026 with Chennai Municipal Corporation being renamed as Greater Chennai Corporation.

The Cooum (Koovam) River flows through its Centre and the Adyar River through its southern portion. The Buckingham Canal runs parallel to the coast, joining the Kortalaiyar (Kosasthalaiyar) River in the northern edges of the city and the Muttukadu backwaters south of the city. Both rivers are heavily polluted with effluents and trash from domestic and commercial sources. The Adyar, which is much less polluted than the Cooum, is de-silted and cleaned periodically by the state government. A protected estuary of the Adyar forms the natural habitat of several species of birds and animals. The Buckingham Canal, 4 km (2.5 mi) inland, travels parallel to the coast, linking the two rivers. The Otteri Nullah, an east-west stream runs through north Chennai and meets the Buckingham Canal at Basin Bridge. Several lakes of varying size are located on the western fringes of the city. Red Hills, Sholavaram and Chembarambakkam Lake supply Chennai with potable water. Groundwater sources are mostly brackish. Chennai is well connected by road, rail, air, and sea. It has an international airport and seaport. Within the city a network of bus services and auto-rickshaws are common modes of transport.

Historically, Chennai faces problems of water supply shortages as no big river flows through it with a resulting over-reliance on annual monsoon rains to replenish water in reservoirs. The city's ground water levels have been depleted to very low levels in many areas. Many residents buy their drinking water. The entire Chennai core city is divided into 18 Water distribution Zones (WDZs) based on storage facilities in the area. However, the present system could not ensure equitable water supply with adequate pressure at

all points due to improper zoning/operational problems/inadequate distribution management system.

In 2016, the Government of Tamil Nadu established a Master Plan for Water Supply and Sewerage Sectors (MPWSSS) for Chennai Metropolitan Area (CMA). The aim of MPWSSS was to develop a proper overall long- term plan to fulfil the expected water supply demands and sewerage services over a 30-year horizon starting from 2020 up to 2050. According to the output of the master plan and based on water demand statistics (2015), the Government of Tamil Nadu noted a 36% deficiency between the supply and demand (686 MLD against 933 MLD) upon which, it was decided to establish an additional new Water Desalination Plant (DSP) of capacity 400MLD for overcoming the identified deficiency and to secure reliable water sources for consumers of CMA.

Chennai Metropolitan Water Supply and Sewerage Board ("CMWSSB" or "the Client") is responsible for the administration and operation, and maintenance of Chennai City's water production, treatment, storage, distribution, billing and revenue collection. The present water supply system is intermittent due to various constraints in source, storage facilities and inadequacy of the existing distribution system. The Chennai Core city's average per capita water supply is around 101 LPCD. To improve the current water supply situation, the Chennai Metropolitan Water Supply and Sewerage Board (CMWSSB) has obtained loans from funding agencies such as JICA and World Bank through the Tamilnadu Government to supplement current supplies and water infrastructure. A DPR has been prepared for JICA Assisted "Project for Construction of 400 MLD Capacity Seawater Reverse Osmosis Desalination Plant at Perur and Allied Works by a consortium of Consultants, SMEC International / TCE / NJSE India / SMEC India". The Project report was prepared for the development of source & conveyance of water for capacity of 400mld and providing 24x7 water for Area X and XIII (prioritized areas) for improving water supply services.

Chennai Metropolitan Water Supply & Sewerage Board (CMWSSB) has engaged Water Corporation of Odisha (WATCO) for providing Project Management Consulting Services for the work of "Improvement of existing Water Distribution Network in Water in Area-X and Area-XIII of Chennai City for achieving 24x7 water supply". The Contract Agreement between CMWSSB and WATCO was signed on 20th July 2023 for a period of 48 months. WATCO has implemented 24X7 water supply projects in different cities and urban local bodies of Odisha.

1.2 Need for the project:

The entire Chennai core city is divided into 18 Water distribution Zones (WDZs) based on storage facilities in the area. However, the present system does not provide equitable water supply with adequate pressure at all points primarily due to improper zoning,

absence of discrete DMAs, interconnection between operational zones and inadequate capacity of distribution pipes/reduction of flow area due incrustation.

Therefore, it is imperative to formulate a proposal that aims to improve the existing distribution system, ensuring an equitable and sustainable 24 X 7 water supply to all zones within the core city of Chennai. The administrative areas of X and XIII are priority zones based on the client's funding allocation and execution purpose. The present study comprises preparing detailed project report for improving water distribution networks in admin Area XIII, covering Palipattu and Thiruvanmiyur WDS.

1.3 Design Horizon

The project will be commissioned in 2026 (Base year), So, the horizon years are considered 2041 (as an intermediate year) and 2056 (the ultimate year).

1.4 Project Area Delineation

Area XIII presently covers a total of 13 wards/Depots numbered from 170 to 182, however, for the Project area covering Palipattu WDS and Thiruvanmiyur WDS, only 7 depots including 1 partial depot are covered, namely Depot No.s 169 (P), 170, 173, 174, 178, 179 and 180. The map showing project area is provided at Figure 1.1 below. The salient features of the project area are provided in the Table 1.1 below:

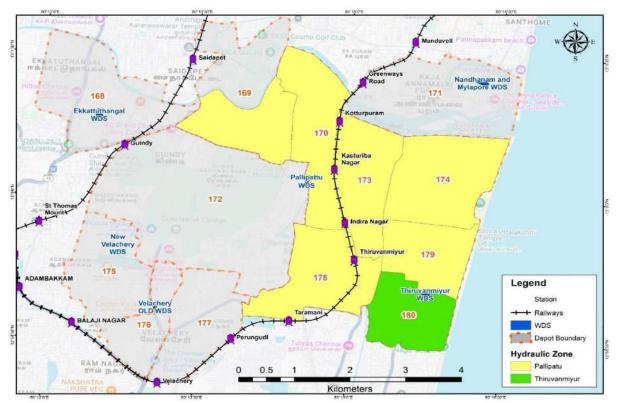

Fig 1.1: Project Area Map

01		A X7777	
SI.	Details	Area XIII	Project Area
No.			
1.	Area (sq.km)	40.22	18.05
2.	Total Number of Depots	13	7 (6 full and 1 partial)
3.	Population as per 2011 Census – For Area XIII	5,49,760	-
4.	Base Year Population Adopted 2026 – For Project Area	6,08,270	3,28,1172
5.	Intermediate Year Population Adopted – 2041 – For Project Area	6,62,450	3,63,826
6.	Ultimate Year Population Adopted – 2056 – For Project Area	7,19,410	4,02,159
7.	Total number of Assesses (Based on previous DPR)	1,27,469	-
8.	Total numbers of Households (Per Survey)	1,36,869	63,933
9.	Total number of House service connection (Per Survey)	95,149	-
10.	Total No. of Premises (Per Survey)	75,618	38,668
11.	No of metered connections (Per previous DPR)	2,036	2,036
12.	Length of Roads (in Kms)	535 km approx.	270 km approx.

Table 1.1: Salient Features of Admin Area XIII – Palipattu WDS & Thiruvanmiyur WDS

1.5 Broad Scope of Services

- a. Primary and Secondary data collection and study of existing reports
- b. Survey and Investigations: Asset Survey, Consumer survey and condition assessment survey.
- c. Planning and design for converting the existing intermittent water supply to 24 X 7 in project area under Areas X and XIII of CMWSSB.
- d. Preparation of Detailed Project Report (DPR).
- e. Preparation of technical specifications and tender documents for the works.
- f. Assisting the employer in bidding process and recommendation of the right bidder for award of the works contract for 24 X 7 sustainable water supply.
- g. Services covering approval of detailed designs, coordination with the contractor, works monitoring, assist in dispute resolution, specialized techno-commercial advice during execution of work for ensuring completion of the work in a time bound manner.
- h. Assist the employer in monitoring the implementation of the works and commissioning of the works.

1.6 Basic Design Objectives:

To achieve the specific needs of the project, the following broad design objectives have been evolved.

- 1. Ensure continuous water supply on a 24/7 basis.
- 2. Achieve client's operational needs to satisfy minimum residual pressure of 17m during peak supply hours.
- 3. Establish district metering areas within each zone to be hydraulically monitored and locally controlled through Automation.
- 4. Introduce proper Instrumentation, control and automation system to achieve smart water management.
- 5. Provide a control strategy for reduction of NRW (Non-Revenue Water) based on leak detection devices locally managed.
- 6. Implement water quality monitoring points locally managed.
- 7. Maximize the benefits of the existing assets by applying optimization techniques based on hydraulic modelling and outcome of condition assessment survey.
- 8. Design the house services connection and ensure a proper metering, billing and collection strategy for economic gains and self-sustainability.
- 9. Implement proper operational strategies that are necessary for providing efficient water supply services and maximizing the assets' lifespan.

The PMC design team has adopted a design philosophy that ensures the application of modern technology, problem-solving techniques, and engineering sustainability concepts. The design approach will include optimization and reliability-based engineering solutions that are flexible and readily available. The proposed solutions and alternatives also considered possible risks as a function of supply, demand, and operational processes, supported by evidence-based hydraulic analysis simulations using Water Gems hydraulic modelling software developed by BENTLEY.

CHAPTER -2-EXISTING WATER SUPPLY SYSTEM

2.1 INTRODUCTION

This chapter provides a brief outline of the existing water supply system of Chennai Core City with details of Water Supply Sources, Water Treatment Plants (WTPs), Transmission Mains, Pumping Stations, Zone-wise Water Distribution Stations (WDS), Service Reservoirs and Distribution Systems serving the zones and specific existing water supply infrastructure of the project area under Admin Area XIII. The admin boundary map showing various depots under area XIII is shown in figure 2.1 below.

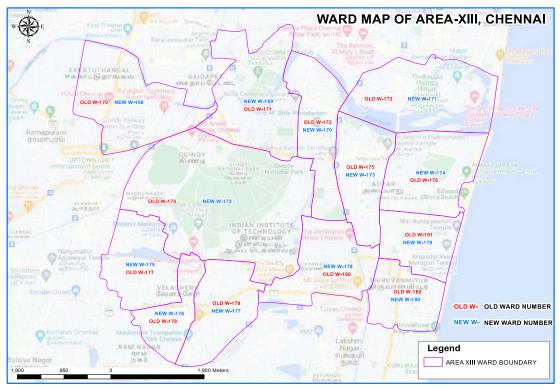

Fig: 2.1 AREA XIII – Admin Boundary Map

2.2 WATER SUPPLY SOURCE

Presently Chennai core city receives water from four different water supply sources, i.e. surface water, groundwater, seawater desalination plants, and wastewater recycling plants, as presented in table 2.1 below,

Sl. No	Production facilities	Capacity (MLD)	Source of water
1	Kilpauk WTP, Surapet WTP, Puzhal WTP, Chembarambakkam WTP	1114	Poondi, Red hills, Cholavaram & Chembarambakkam lakes and Telugu Ganga Project
2	Vadakuthu WTP	180	Cauvery River (Veeranam Reservoir)
3	Minjur DSP	100	Convertor
4	Nemelli DSP	100	Seawater
5	Nemelli DSP	150	Commissioned in the year 2024
6	Groundwater	128	Northern well fields and Extended area well fields
	Tertiary Reverse Osmosis Plants at Koyambedu and Kodungaiyur	90	Sewage water Commissioned in the year 2019
Total	of Core City	1862	

Table 2.1: Different Water Sources

However, Area XIII water distribution stations (WDS) receive treated water mainly from three sources, namely Vadakuthu WTP, Chembarambakkam WTP and Nemmeli DSP. The details of each WDS under Area XIII with their source connectivity and beneficiary Depots are tabled below in table 2.2.

Table 2.2:	WDS Area	with Source
-------------------	----------	-------------

<mark>Sl. No.</mark>	WDS Name	Beneficiary Depots	Sources
1.	Nandanam	173, 122, 123P ,126P	Chembrambakkam & Vadakuthu WTPs and Nemmeli DSP
2.	Thiruvanmiyur	175P, 176P, 180P, 181P, 182P	Nemmeli DSP

2.3 RAW WATER TRANSMISSION SYSTEM OF CHENNAI CORE CITY.

The schematic drawing of the raw water transmission mains system Chennai core city area is shown in figure 2.2 below, the total length of the raw water rising main is around 367 KM.

RAW WATER TRANSMISSION SYSTEM FOR THE CHENNAI WATER SUPPLY SYSTEM

Fig: 2.2 Raw water transmission network - Chennai water supply system

2.4 DETAILS OF EXISTING WTPs AT CHENNAI CORE CITY

The total installed capacity of water treatment system for the city is 1862 MLD, consisting of 69 % treated water capacity coming from 5 WTPs, 19% from three number desalination plants, 7% from ground water & 5% from tertiary RO plant. Details are presented in Table 2.4 below.

S. No.	Production facilities	Capacity (mld)	Source
1	Kilpauk WTP Surapet WTP Puzhal WTP Chembarambakkam WTP	1114	Poondi, Red hills, Cholavaram, Chammbarambakkam lakes, Telgu ganga Project
2	Vadakuthu WTP	180	Cauvery River (Veeranam Reservoir)
3	Minjur DSP	100	Sea Water
4	Nemelli DSP	100	Sea Water

5	Nemelli DSP	150	Sea Water
6	Ground Water	128	
7	Territory RO Plant at Koyambedu and Kodungaiyur	90	Sewage Water Commissioned in 2019
	TOTAL	1862 MLD	

2.5. CLEARWATER TRANSMISSION MAIN:

Treated water from WTPs and Desalination plants is transported to 18 water distribution stations located in core city of Chennai. Length of transmission main is 490 kms and dia is ranging from 225 to 2000 mm and of material CI, PSC, DI and MS. In addition to the above pipeline, clear water rising main of 40KM length of dia 1200-1400mm and of DI 300mm of length 9km exist from 100 MLD Nemelli Desalination Plant to the core city. Further the existing 1400mm dia MS pipeline from 150 MLD Nemelli Desal Plant to Shollinganallur Intermediate Pumping Station for a length of 21.95 km, 1200mm dia MS pipeline from Akkarai Intermediate Pumping Station to link with existing 1200mm dia

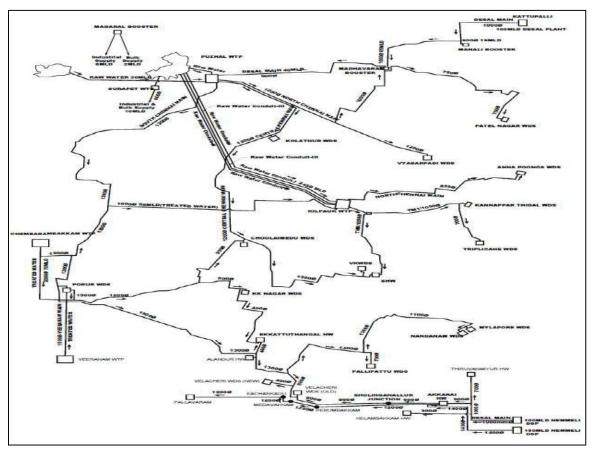

Fig: 2.3 Clearwater transmission main layout diagram of Chennai Core city

pipeline at Pallavaram GST Road for a length of 16.67 km. Schematic layout of existing clear water transmission network is presented in figure 2.3 below.

2.5 Water Distribution Stations:

There are 18 Water Distribution Stations (WDS) in Chennai's core city. Initially designed as isolated hydraulic zones, over time, numerous interconnections have been established between these zones. This has affected the efficiency of demand-supply management from an operational and maintenance perspective. The WDS under operation having their own water storage capacities are detailed below in table 2.5.

WDS	Name of WDS	Under-	Elevated	Planned Supply	Supplied by
Zone		ground	Service	Volume (mld)	
		Tank (ml)	Reservoir		
1	Kilpauk	81.32	15.80	94	Pump &ESR

2.5.1 Thiruvanmiyur WDS:

Thiruvanmiyur WDS

Thiruvanmiyur WDS Pump House

This WDS located at East Seaward Road under depot no 180, which is fed treated water from Nemmeli DSP. This WDS distribute water to part of depot 173, part of depot 174, part of depot 178, part of depot 179 and part of depot 180 of Area XIII. The existing UGR of 3 ML and ESR of 0.70 ML capacity planned to supply 5 MLD through pumping as well as through gravity from ESR. The existing pumping system includes 6 nos 55KW of HSC pumps (2W+ 4S) discharges water at head 32m with pumping rate 9.07 MLD.

2.5.2 Palliapatu WDS:

This WDS located at Sriram Nagar Main Road, near IIT Chennai, under depot no 170, which is fed treated water from from Chembarambakkam & Vadakuthu WTPs and Nemmeli DSP. This WDS distribute water to part of depot169, part of depot 170, part of depot 173, part of depot 174, part of depot 178, part of depot 179, part of depot 180 of Area XIII. The existing UGR of 17.0 ML and ESR of 0.70 ML capacity planned to supply 29 MLD through pumping as well as through gravity from ESR. The existing pumping system includes 6 nos 180 KW of vertical turbine (VT) pumps (2W+ 4S) discharges water at head 32.5 m with pumping rate 36.29 MLD.

Palliapatu WDS

2.7. Water Distribution Network

Based on the data from CMWSSB, the core city's water distribution network spans approximately 2,381 km. Most of this network has been redeveloped according to the Detailed Project Report (DPR) titled "Detailed Engineering Design of Water Distribution System for Chennai City," prepared by M/s Kirloskar Consultant in September 2018. According to the JICA report in the year 2017, the total length of the distribution network, based on field data, is around 2,303 km. This network comprises of various materials: CI (91.62%), uPVC (6.17%), DI (1.80%), GI (0.38%), and AC (0.03%), with diameters ranging from 40mm to 750mm. As presented in Table 2.7 below.

	Table 2.7. Diameter, length and material of pipe

Source – Earlier prepared DPR

Since no consolidated database for pipeline inventory was available, the PMC (WATCO) engineers have visited the Area/Depot offices and collected the available data and drawings pertaining to the project area i.e. Area XIII covering Palipattu WDS and Thiruvanmiyur WDS.

2.8. Existing Scenario – Area XIII

Area XIII, (Adyar) is part of the project area covering 13 wards, i.e. from Depot no. 170 to Depot no. 182 with an area of 40.22 Sq km and a road network of 520 Km. The total population of this area as per the 2011 census is 5,49,760. Presently, this area is being served by six existing WDS located within the Area XIII admin area. In addition to the above WDS, some overhead tanks are located within area XIII, but most of them are not operational due to their condition, lesser capacity, and smaller staging height.

2.8.1. Water Distribution System and Pumping Facilities

At present, Area XIII is supplied with water through 6 no.s of WDSs with a combined storage capacity of 45.5ML. The below table 2.8 shows the WDS wise storage and pumping facilities of Area XIII.

S No	Existing Storage Facilties (ML)				Existing Pumps Configuratio n		Type of Pumps		Beneficiary Depots
	WDS Location	UGR (ML)	OHT (ML)	Staging ht (m)	Discharge (MLD)	Head (m)	No (W+S)	Туре	
1	Nandanam	11.0	-	-	45	30	2+1		173,122,123P and 176P
2	Thirvanmiyur	3.0	-	-	9	32	4+2		175P,176P,180P,1 81P,182P
3	Palliapattu	17.0	0.7	10	36.29	32.5	4+2		171P,172P,175P,1 76P,180P, 181P, 182P

5	Velacherry Old	7.3	-	-	32.8	32.2	2+1	V T	177,178,179 and 174P
6	Velacherry New	2.0	-	-	6	34	4+2	HSC	174P

Table 2.8: WDS wise storage and pumping facilities of Area XIII

Source: Site information

It is understood that none of the command areas under the above WDSs is isolated; multiple interconnections were made in the distribution network between the command areas. Further, the operational areas and depots of CMWSSB are aligned geographically to the depots but not spatially to the water distribution stations. Due to this misalignment, interface issues across the areas are always in place, resulting in the inefficiency of 0 & M Works.

2.8.2. Existing Distribution System – Area XIII

As per the latest site information, drawings and data collected and digitalized by PMC (WATCO), the total length of the existing pipeline in the area is about 520 Km, with the diameter ranging from 100 to 1100 mm for a total road network length of around 535 km. The CI piping material comprises 74.47% of the total pipe-lengths with DI 21.76%, and MS and PVC piping material comprise 0.01 % and 3.76%, respectively. 69.1% (around 359.9 km) of the total piping lengths have 100/110mm diameter, 12.08% of the total piping length have 150/160mm diameter, while the rest of 18.82% has diameters ranging from 200 mm to 1100mm. From the above information, nearly 30.9% of the road network is not covered by 100mm diameter pipeline where HSC connections need to be made. CMWSSB continues to provide HSC connections for all pipe diameters ranging from 100mm to 250mm, which is not desirable for better management of the system. Present Water Supply in area XIII is intermittent with a daily average supply of 3 to 4 hours. Dia and material-wise existing distribution network breakup of Area XIII is presented in Table 2.9 below.

Table 2.9: Existing Distribution system Details of Area XIII

2.8.3. House Service Connections:

As per the latest CMWSSB records, the total number of House Service Connections existing in area XIII is 93113, of which 2036 (i.e. 2.18 %) are metered and the rest all unmetered. Out of 2036 metered connections, 1854 are AMR and the remaining are non-AMR. Depot wise House Service Connections (HSC) with meters are presented in Table 2.10 below.

	Table 2.10: House Service Connections – Area XIII

CHAPTER -3-SURVEY &INVESTIGATION

3. INTRODUCTION

This chapter consists of the followings,

- Topographical Survey
- Asset Survey & Mapping
- House Level Survey
- Conditional Assessment Survey of Pipeline

3.1. TOPOGRAPHICAL SURVEY

3.1.1 Introduction

Prior to topo survey, secondary data, as available, such as Depot and Area Boundary maps, Water Distribution network drawings etc were collected. The collected documents were analyzed and further discussed with officials of CMWSSB. Thereafter, topographic survey was carried out through DGPS (Differential Global Positioning System). The Survey was with reference to known base point (provided by CMWSSB), Base stations were then fixed at identified suitable locations. Topographical features like road width, side shoulders, and important infrastructures along the roads were captured. Pictures showing the Ground control point (GCP) provided by CMWSSB and base stations identified for triangulation given in image 3.1 & 3.2 respectively. The surveyed area is flat terrain with elevation ranges varying between 1m to 8 m with respect to MSL.

Image-3.1: GCP #16 and #23 PROVIDED BY CMWSSB

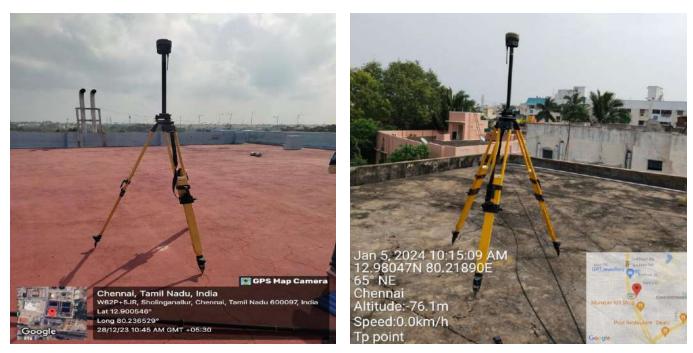

Image 3.2: Base Station for Triangulation

3.1.2 Methodology & Process

The following sequence of activities were carried out using DGPS instruments to capture levels of road, topographical features like road width, side shoulders, other important structures and levels of water supply assets such as tapping & receiving point of house connections, pump house & water distribution stations.

3.2. ASSET SURVEY

3.2.1. Introduction

The GIS based Asset Mapping work of the existing Water Supply system involved detailed inventorying and documenting of all components, from Pumping Stations to pipelines and distribution networks. This process started with field surveys, where data on the location, condition, and specifications of assets is collected using DGPS (Differential Geo Positioning System). Then, Geographic Information System (GIS) technology was used to create a geo-reference digital map, showing the spatial distribution and attributes of each asset. This helps in better management, maintenance, and planning of the water supply system.

3.2.2. Process of Data Collection, Validation & Updation

Data Collection:

- Study & analysis of Existing asset database.
- Identification and marking of Points of Interest, namely, landmark areas, sub-areas, location etc.
- Generation and printing of section wise/ward wise Asset maps in soft/hard copies.
- Survey of existing & new water supply assets for ground truthing by GPS/DGPS.
- Asset data module updation.

3.2.3. Asset map and database

- creating database of assets for Inventory management & smart solution,
- Asset map development
- Attribute data linking
- GIS based Mapping of existing, new & replaced assets.
- Asset Map and Drawing preparation

3.2.4. Summary of Pipeline Assets and Depot-wise Asset maps

3.2.4.1. Pipeline Assets of Area XIII

Asset survey has been conducted on site using DGPS survey followed with development of asset survey maps on GIS platform duly validated by the Department. As per the asset survey of area XIII, the total lengths of the existing pipelines are about 630 km with diameter ranging from 100mm to 1100mm. The CI piping material comprises of nearly 81.16% of the total pipelengths, while DI and PVC piping material comprises 14.88% and 3.93 %, respectively, with 0.03% only MS piping and other materials. Material-wise Pipeline breakup is presented in Table-3.1 below.

DEPOT	LENGTH IN METERS						
	CI	DI	PVC	MS	OTHERS		
168	128.27	47563.48					
169	46341.25	939.916					
170	39882.20	369.42	292.48				
171	34157.80	475.06					
172	37260.07	8208.52	263.51

TOTAL	511434.84	93785.85	24813.85	15.2	109.8		

Table 3.1: Depot wise pipeline length - material wise of Area XIII

3.2.4.2. Pipeline Assets of Project Area

Based on the asset survey, the total lengths of existing network which would be connected to Pallipatu WDS for distribution of water is 245.69 KM & the network connected from Thiruvanmiyur WDS is 49.79 KM. The total length of existing distribution pipeline considered in this DPR is 295.46 KM. The abstract of diameter wise pipe length in individual operational zones is presented in below Table-3.2.

Asset maps of water distribution station (WDS) and water distribution network (WDN) depot wise were prepared and further verified from the depot engineer. The verified maps were used for design of the water supply network. The maps were digitally reproduced in GIS platform using ArcGIS and ArcMap. and the asset database were developed. Operational zone wise asset maps & drawings of Pallipatu WDS & Thiruvanmiyur WDS are appended Under Appendix 2. A validated approved model map, Pallipatu WDS & Thiruvanmiyur WDS drawings are presented below in figure 3.1, 3.2 & 3.3 respectively, for better appreciation.

3.3. HOUSE LEVEL CONSUMER SURVEY AND DATA COLLECTION:

3.3.1. General

A house level survey for a 24x7 water supply project is critical for understanding the current water usage patterns, identifying gaps, and planning for uninterrupted supply. This involves collecting data from individual households about their current water access, consumption habits, and any issues they face.

The survey typically covers:

- Water Sources: Identifying where households currently get their water (borewells, municipal supply, etc.)
- Water Consumption: Measuring daily or monthly water usage.
- Access and Quality: Assessing the frequency and quality of water supply.
- Infrastructure: Noting the condition and type of water delivery infrastructure (pipes, tanks, etc.)
- Willingness to Pay: Gauging households' readiness to pay for a consistent 24x7 water supply.

3.3.2. Necessity of Household Survey

Household survey is the key for calculation of demand for designing of water supply system. The information collected through household survey shall be used for following process:

- 1. Demand calculation and allocation in District Meter Area (DMA)
- 2. To understand demand for institutions, hotels etc
- 3. To understand the quantity of water received by consumers.
- 4. To understand about existing sources and its sustainability.
- 5. This helps to identify revenue gaps.

Therefore, household survey is necessitated for precise demand allocation for hydraulic design of the distribution network.

Through this house level survey, geo-coordinates of premises, connection points, households and population, type of house, floors, quantity of water received by residents etc. were collected.

House level survey in areas X and XIII were carried out using **mobile application**, which integrates all DGPS (Differential Global Positioning System) data with a base map layer. This ensured accuracy in capturing the Geo- coordinates of each surveyed household.

The questionnaire for the survey was prepared in consultation with officials of CMWSSB. A mobile application was developed to capture the requisite information through the survey. Subsequently, the application and the process were piloted in one of the depots of area XIII. Based on the results of piloting, the application was further fine-tuned and processes were strengthened. All fields and columns have been incorporated into the application as per the specifications provided by CMWSSB.

3.3.3. Structure of the Survey Questionnaire

The questionnaire is structured into **seven distinct sections**:

- 1. **Geographical Information** This section captures the location-based details of the premises.
- 2. **Topological Information** This covers the structural layout and characteristics of the house.
- 3. Social Information Includes demographic and household composition data.
- 4. **Building Information** Details regarding the construction and design of the building.
- 5. **Water Use Information** This section focuses on water consumption patterns and sources.
- 6. **House-Level Connection Information** Information about the household's water supply connections.
- 7. **Survey Requisites** Any additional data or documents required for completing the survey.

To carry out the humongous survey activity, dedicated survey teams were formed lead by an experienced lead surveyor. All team members were field trained before they could start the work at site. An appropriate plan, based on individual coverage, was devised and the field team was capacitated to carry out the task within the schedule.

Based on the plan, each surveyor visited the assigned area / street / houses and collected the required data in accordance with the structure outlined above. The developed survey application allows for seamless data collection, ensuring both spatial and non-spatial data are captured accurately and efficiently. The questionnaire utilised is presented in Table 3.4 below.

3.3.4. Summary of House Level Survey of Area XIII

The abstract of House level survey is presented below in Table 3.4.1. The detailed Survey output, depot wise, was submitted to CMWSSB separately.

Referring Table 3.4.1, under area XIII, total number of premises, household & population are 82388, 136829 & 669501 respectively.

S. No.	DEPOT NO	No. Of Premises	No. Of Household	POPULATION
1	168	5855	10928	56017
2	169	3521	11002	42731

Table 3.4.1: Summary of House Level Survey of Area XIII

3.4. CONDITION ASSESSMENT SURVEY

3.4.1. Background

Water distribution systems contain different types of buried pipes (i.e., cast iron, ductile iron, asbestos cement, polyethylene, and polyvinyl chloride). As water distribution systems become older, their structural condition, hydraulic capacity and performance deteriorates. Several factors impact the structural deterioration of water mains and their failures, including pipe material, pipe size, pipe age, soil type, climate, and cyclic pressures. However, the physical processes that cause pipe breakage are very complicated. Most water pipes are buried, so there is little data available about how they deteriorate and fail. Deterioration of water mains is neither identical nor uniform. This is because water mains are operated under pressure, and usually unreachable. Therefore, it is essential to inspect and assess water system conditions to efficiently maintain and improve its elements to prevent catastrophic failures and emergency repairs.

In present context out of total length of 630KM of pipeline diameter ranges between 100mm to 1100mm distribution system under area XIII, the length of cast iron (CI) pipes constitutes about 81.16% were DI pipeline comprise of 14.88%, where PVC pipeline consist of 3.93 % & others are 0.03%. Out of the total length 95% are metallic pipes (DI & CI) of which significant length is older than 20 to 30 years.

The metallic pipes under operation are venerable to external corrosion, erosion internal encrustation after use for longer period, results in reduction in diameter & affecting carrying capacity of pipelines.

Accordingly, it is important to conduct conditional assessment survey of the metallic pipes, moreover the PVC pipes are already designated for replacement by DI pipes due to structural strength & better pressure sustaining capacity of DI material.

In the present context based on available technology and ease of doing, conditional assessment of the buried distribution pipes in each depot of area XIII has been caried out by a combination of hydraulic, non-hydraulic, on the spot hardness test and destructive testing facilitated. Ground penetration radar survey for identification of precise location of pipeline. A brief description of various techniques adopted in survey are as follows:

- **GPR Survey** It is a non-intrusive method of surveying the sub-surface to precisely locate underground utilities below the ground
- Flow measurement (Hydraulic)using clamp-on type portable Ultrasonic flow meter that attach to the exterior of the pipe (and fit a variety of pipe sizes) and enable measurement of flow of liquids without damage to the ultrasonic sensor.
- **Destructive Testing (often abbreviated as DT)** is a test conducted on a sample of pipe to find strength of material., During the process, the tested item undergoes stress that eventually deforms or destroys the material.
- **Hardness Test** A hardness test is typically performed by pressing a specifically dimensioned and loaded object (indenter) into the surface of the pipe material that is being tested.

• **Robotic camera inspection**(Non-hydraulic method) conducted using Pipe inspection robots, also known as robotic pipe inspection cameras or sewer crawlers, are specialized tools used to inspect the inner physical state of pipes and sewer systems.

3.4.2. Steps followed for the survey

While carrying out the conditional assessment, the following steps were taken:

- 1 Collection of Historical Data
- 2 Prepare/collect -Zone wise pipe network Map
- 3 Mobilization of Men and machinery
- 4 Identify All Critical Pipe Location on Field
- 5 Identification of underground junctions through GPR survey.
- 6 Markup/identify the test Location in Map
- 7 Permission from various departments in consultation with CMWSSB for carrying out all tests at site .
- 8 Safety barricading / Traffic Management
- 9 Digging up to required level
- 10 Carry out the Tests
- Flow measurement through Ultrasonic clamp on flow meters
- Brinell's Hardness Test
- Destructive Testing of sample pipes collected from existing distribution system
- Robotic camera Inspection

11 Spool pieces of pipe are to be placed where destructive and robotic tests were carried out.

- 12 The test pits are to be restored with proper backfilling and concrete at the top.
- 13 In case of damage to other utilities restoration was done.
- 14 Sample collection from site and delivery at designate Lab for testing
- 15 Field Test result

3.4.3. Identification of Pipeline Stretches for Conditional Assessment Survey

Based on the study of historical pipe performance data from Depot Log books, complaint register and local enquiry, problematic areas have been identified which are classified under four categories such as:

- Frequent Breakdown areas
- Low pressure areas
- No water supply areas
- Poor water quality areas

These areas have been mapped on depot wise distribution pipe asset maps identifying the representative pipe lengths/junctions/intersections for carrying out GPR survey for precisely location of the pipeline underneath as shown in maps are appended in Appendix 3 for carrying out condition assessment survey with required techniques. These location maps have been vetted by CMWSSB.

3.4.4. Approach and Methodology Process Flow Sheet

A detailed approach, identifying each process and considering time required for the activities, was developed and adopted to carry out the condition assessment Study as provided in the Figure 3.3 below.

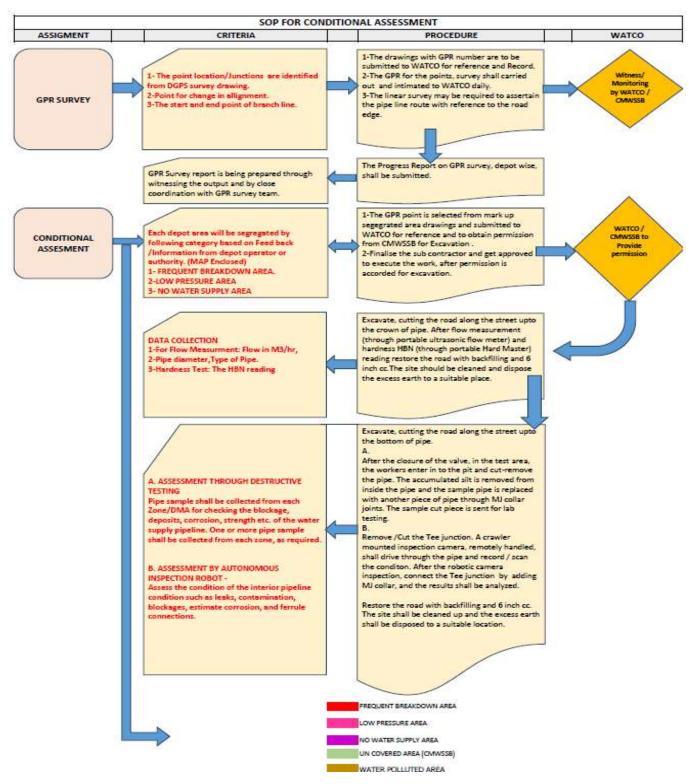

Figure 3.4: Approach and Methodology Flow Sheet

3.4.5. Technology adopted for Condition Assessment

3.4.5.1. Ground Penetrating Radar (GPR)

Ground-penetrating radar (GPR) is a non-intrusive geophysical method that uses radar pulses to image the underground utilities. GPR Surveys are used to find the exact location of natural or man-made objects underground, natural elements or detect changes in the position of those objects. For carrying out the work, SUE method and EPL (data storing) was used. As presented in Image 3.3 below,

Image 3.3: GPR equipment

3.4.5.2. Ultrasonic flow meter

In water supply systems, the common methods used for flow measurement consists of differential pressure types, displacement types, inferential types, magnetic types, ultrasonic types, and open channel types. Ultrasonic clamp-on flow meters measure fluid flow in water mains. By using sound waves to determine the transit time of a gas or liquid, ultrasonic flow meters can accurately monitor any changes in flow, both upstream and downstream. Clamp on flow meter usage is presented in the Image 3.4 below.

Image 3.4 - Ultra sonic flow measurement

3.4.5.3. Hardness Test at Field

Hardness testing is a test method that involves applying a constant load via a rounded or pointed object, under controlled conditions, to create an indentation in a metal surface. This is then measured to determine the hardness of the material. Hardness tests on pipes are performed primarily to examine two aspects: testing of weld seams and determination of the basic hardness of the pipe depending on the application. Hardness tests are performed to ISO 6506-1 (Brinell) using portable Brinell hardness tester. All Brinell tests use a carbide ball indenter. As presented in image 3.5 below, The test procedure is as follows:

- The indenter is pressed into the sample by an accurately controlled test force.
- The force is maintained for a specific dwell time, normally 10 15 seconds.
- After the dwell time is complete, the indenter is removed leaving a round indent in the sample.

- The size of the indent is determined optically by measuring two diagonals of the round indent using either a portable microscope or one that is integrated with the load application device.
- The Brinell hardness number is a function of the test force divided by the curved surface area of the indent. The indentation is considered to be spherical with a radius equal to half the diameter of the ball. The average of the two diagonals is used in the following formula to calculate the Brinell hardness.

3.4.5.4. Destructive Test

Destructive testing is undertaken in order to understand a specimen's performance or material behaviour, these procedures are carried out to test specimen's failure. Destructive testing procedures can either follow specific standards or can be tailored to reproduce set service conditions. Brinell hardness testing machine as presented in image 3.6, 3.7 & 3.8, is used to determine the strength of the pipe sample.

Image 3.6: Site Excavation for Destructive Testing

Image 3.7: Brinell Hardness Tester

Image 3.8: Cut piece of pipe for lab testing

Image3.9: Inspection through the robotic camera

3.4.5.5 Inspection of underground pipeline through robotic camera

In this method a section of pipe is selected and removed, an autonomous inspection robot fitted with camera and hydroponics inserted into the section opening to assess the interior of the pipeline such as leaks, blockages, encrustations, ferrule connections etc. This helps to pinpoint the exact location of failure and give a detailed analysis to allow the data analysis managers to determine the pipe strength/condition. Inspection through the robotic camera is presented in the below Images in **Image-3.9**.

The activity of condition assessment, through GPR, Flow & Pressure measurement, Hardness test, Destructive testing & robotic visual inspection, was carried out with the standard practice and the Condition Assessment Report was submitted to CMWSSB. The Condition Assessment Report is annexed at Appendix 3. A map of model is presented in figure-3.10 below, for better appreciation.

Fig 3.10: Condition assessment - Survey Locations

3.4.6. Condition assessment Survey Processes and outcomes

3.4.6.1. GPR Survey

Based on the preliminary data collected and analysis thereof some locations were identified and the GPR survey was carried out. Subsequently the work progressively covered the area under each Depot of Area XIII. In the following paragraphs, the field methodology is described and related GPR findings. *One number of trial pit is made at different locations in each Depot* to verify the results of the GPR survey. Site pictures are presented in Image-3.11 below,

Image-3.11 GPR Survey

The depth, diameter, exact location of Tee-points, change of alignment were recorded by the method using GPR and EPL (Data storing) Technology. The location reference was identified from GIS Map of DEPOTs. The GPR survey carried from tail end to start point at night time when noise level are minimal. The number of locations of the Area XIII (depot wise) GPR Survey done in each depot is listed in Table-3.8.

Table-3.8: Showing Depot-wise GPR survey locations

Locations													
Survey													
Completed													

When the GPR unit crosses the utility, the display screen of the GPR shows an image of hyperbolic shape (inverted V) such as presented in Figure-3.12 below,

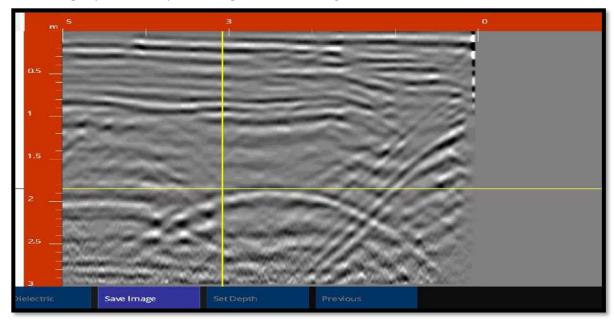

Figure 3.12: Machine Screen shot

The apex or top of the hyperbola is the position of the utility. The distance to the top of the hyperbola is an estimate of depth. By moving the GPR back and forth and marking the ground where the top of the hyperbola is observed, the alignment of the subsurface utility can be traced out as the X's in Figure indicate. The inverted V visible on each transect, clearly identifies the alignment of the pipe. *The detail list of locations with co-ordinates are included in* Appendix -3.

This annexed data will provide the knowledge for locating the underground pipeline and junction for future reference.

The key map for each depot with indicating the GPR point included in Appendix -3

The GPR survey was carried out for each location and the drawing prepared with taking latitude -longitude with depth of pipe. The individual GPR location drawing has been prepared for future reference and identification of point. The sample drawing is presented in Figure-3.13 and 3.14 below.

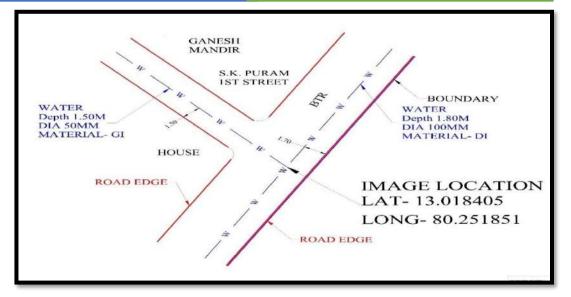

Figure 3.13: Sample drawing

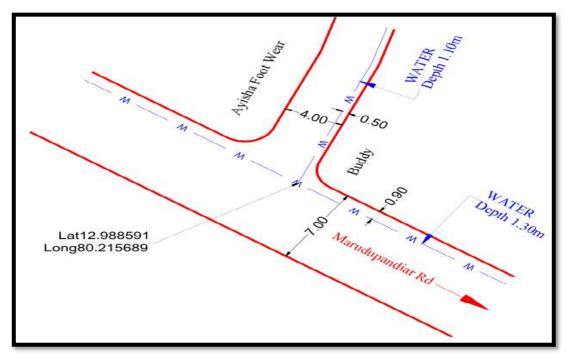

Figure 3.14 – GPR result output (samples)

The details for each locations wise map with co-ordinates are included in Appendix -3.

3.4.6.2. Flow Measurement

Prior to start of flow measurement, locations are identified from the historical data under each depot. Locations from GPR survey were analyzed and used for identification of suitable locations for flow measurement. After getting the permission for working in the nighttime, the excavation was carried out at the identified location to trace the pipe. Then flow measurement was carried out during the water supply time through clamp on ultrasonic flow meters. This is used in the field due to easy transportation and installation

requirements. However, performance of these meters may vary in different diameter pipes and under non ideal conditions wherein sufficient minimum straight length as prescribed by the manufacturer may not be available at site. Flow measurement photographs are presented in Image-3.15 below.

Image 3.15: Flow measurement using Ultrasonic clamp on flow meter

The field Observations of flow measurements are tabulated below in Table-3.9 below.

3.4.6.3. Destructive Test

For the purpose of destructive testing locations were identified from available data. After a pipe sample location was finalized, which valve was to be closed to isolate the section was determined. Consumers were notified earlier for interruption of water supply in that area. After valve closure, dewatering/ mud pumps were used to drain the pipe break points. Roads were barricaded, traffic was re-routed, sides of the trenches were protected firmly before workers entered the pit. The sample pipe along with the accumulated silt was removed. After the pipe was replaced, the joints were made leak proof.

Image 3.16: Destructive Testing

The consolidated laboratory test of destructive tests, results are Tabulated in Table-3.10 below. ISO 6506 specifies the method for the Brinell hardness test for metallic materials and is applied. Brinnel's hardness should be >=140.

The detailed reports are included in Appendix -3.

From the above lab results it is found that, out of 65 samples 10 nos of samples are under critical state.

3.4.6.4. Robotic Visual Inspection

Equipment and tools were transported to the site location to perform the inspection with the help of representatives of CMWSSB. Access point in the pipeline was opened and the pipelines were dewatered. Considering the sizes of the pipeline and the space available for insertion of the tools, cameras were chosen to perform the inline video inspection. Safety precautions were taken after thorough preliminary study of the subject to perform the inspection safely.

From the Flow measurement data, the locations to carryout robotic visual inspection were identified and a schedule was prepared to carry out the tasks. Once the site was prepared for inspection, it was handed over to survey team for installing the inspection equipment and carry out the task.

Inspection Equipment's deployed are:

- Video Cameras with DVR
- Endobot/Endoscopy and Other Mechanical Tools
- Personal Protective Equipment (PPE)

The Endobot was inserted into the pipeline through an opening, remotely controlled with the help of a tether. The equipment was driven inside the pipeline through controlled manual-feed or remote in the case of Endobot. The live video feed from the camera is obtained at the base station. The feedback was used to identify and locate the critical spots in the pipeline. The locations of the defects were recorded, and this data is provided immediately for precise localization of the defects/features identified. Risk analysis was done to each section of pipeline inspected. It was done with the help of the below-mentioned matrix in Table 3.8. Initially with all the defects and the condition of the pipeline the probability of failure was calculated. Probability of failure (POF) refers to the likelihood that a particular component or system will fail to perform its intended function. Later, the consequence of the failure is calculated. Consequence of failure (COF) refers to the potential impact or outcome of a failure of a particular component or system.

Out of the total robotic inspections conducted, 39 are presented here that need specific attention. It's estimated that 60% of the total inspections conducted needed attention to ensure safe and quality drinking water. Image-17 presented below shows the site photograph, while doing robotic camera inspection of pipe.

Image 3.17- Robotic Camera Inspection of pipeline

The inspection results, including the imagery and video reference are given in Appendix -3. The consolidated report is tabulated in Table-3.11 below.

3.4.6.5. Hardness Test

There is more pit excavated in addition to pit for Flow measurement. Hardness of the pipe line was checked through portable hardness tester. Hardness is a measurement of how resistant solid matter is to various kinds of permanent shape change when a force is applied. Macroscopic hardness is generally characterized by strong intermolecular bonds, but the behavior of solid materials under force is complex; therefore, there are different measurements of hardness: scratch hardness, indentation hardness, and rebound hardness. When the test is carried out, an impact body with a tungsten carbide test tip is impelled by spring force against a test surface from which it rebounds. Impact and rebound velocities are measured by following method: a permanent magnet integrated into the impact body passes through a coil and induces an electric voltage during its forward and return travel. These voltages were proportional to the velocities and were processed and displayed as the hardness value i.e Brinell Hardness number (HBN) on the indicating device.

Image 3.9 - Hardness test

As per IS-8329-2000 (HBN<=230) but the results are observed mostly greater than 250 HBN. The higher HBN number pipes are at risk conditions. The samples of the pipe are not possible to take from various location for laboratory testing because during cutting the sample piece of pipe it may damage to extended length which cannot be rectified at site with our limited resource. The data recorded 5nos tail end locations in each Depot are listed in Table-3.12 below.

Depot No	Hardne: in HBN o					Brinell HBN	Risk	Below Trend (240)
	1	2	3	4	5

From the above table of field inspection, it is observed that out of 13 field results, pipes in 4 locations hardness value are under high-risk condition.

3.5. SUMMARY OF EVALUATION

The summary of evaluation of the condition assessment results are presented in Table 3.13 below. Overall replacement is estimated at 7% of the total pipe lengths under project area.

Table 3.13: The data from field, evaluation results are tabulated below:

3.6. RECOMMENDATIONS:

- a. Inspection test points are at 5 locations under each depot. The total length pipeline where conditional assessment survey has been conducted is about 5KM.
- b. Location of junctions and alignment of pipe along the street are identified by GPR survey which shall be used for future maintenance work.
- c. The evaluation table results indicate about 7% of pipe for replacement at tail-end that are in a deteriorated condition.
- d. The Robotic test indicated that the flow in some of the area under low pressure which need flushing to maintain the desired flow.
- e. Excluding the above the pipes which are underrated may be replaced

CHAPTER -4-DESIGN CRITERIA

4.1. INTRODUCTION

Design of Water supply system components in the DPR has been carried out based on guidelines of Manual on Water Supply & Treatment-Dec 2023, published by the Central Public Health and Environmental Engineering Organization (CPHEEO), Ministry of Urban Development Government of India and as per provisions of relevant Indian standards & Manuals (IS/BIS codes/SP etc.) and International Standards & Manuals (ISO/AWWA etc.).

This Chapter describes various design criteria used in the design of the water supply system.

4.2. DESIGN PERIOD

Water supply projects are designed to meet the future requirement of a stipulated design period. For CMWSSB project, a design horizon of 30 years is considered as per CPHEEO Manual (Para. 2.8.2.1). Considering the base year of 2026, intermediate design year is 2041 with ultimate design year of 2056. The design period for various components considered is presented in Table 4.1 below.

Sr	Components	Design	Design
No		period	Year
	All Civil structures (Pumping stations,		
1.	Storage reservoirs)	30 years	2056
2.	Pumping Mains & Gravity Mains	30 years	2056
3.	Mechanical and Electrical, I&C Equipment	15 years	2041
4.	Distribution System	30 years	2056

 Table 4.1: Component-wise Design Period

4.3. WATER DEMAND ESTIMATION

4.3.1. Background

The Chennai Metropolitan city has an Underground Sewerage system, Per capita supply has been considered as 150lpcd as per CPHEEO Manual. Provisions are also made for floating Population demand @ 2% of domestic demand and firefighting demands. Commercial & Institutional demands are considered as per field survey.

The details of per capita water demands considered for Chennai Core City (CCC) are presented in Table 4.2

Sl.	Description	Units	Demand	Remarks
No.			Norms	
1.	Per Capita Water Supply (Domestic water Demand)	LPCD	150	As per CPHEEO Guidelines, Para 2.4 Pg 39
2.	Commercial & Institutional water demand	MLD	As per Field survey	CPHEEO Guide lines and observation in field survey
3.	Floating Population	LPCD	2% of Domestic water demand	As per CPHEEO Guidelines, Cl. 2.8.2.5-II Pg no 40 for Class -I Cities
4.	Fire Fighting Demand	KL/Da y	100√P P = Population in Thousands	As per CPHEEO Guidelines, Cl. 2.8.2.5-IV

 Table 4.2: Water Demand Norms Considered for CMWSSB Project

4.3.2. Unaccounted for Water (UFW) Losses in the System

As per the CPHEEO manual (Para. 2.8.2.5-V-Fig 2.4), 15% of UFW losses should be limited in the system. Accordingly, a total system loss of 15% for CMWSSB project (1% in Raw water transmission, 3% in Treatment Plant and 1% in Clearwater transmission & storage reservoir losses and 10% as distribution losses) is considered in the design.

4.3.3. Peak Factor

The per capita water supply indicates only the average water consumption. As far as the design of distribution network is concerned, it is the hourly variation in domestic consumption that matters. The fluctuation is accounted for by considering the peak factor:

Peak rate of consumption= average water consumption x Peak factor.

As per the CPHEEO Manual 2023 guidelines (Chapter-2, S.No. 7, Pg. No. 76), Water distribution networks of urban schemes: Peak factor should be considered as 2.5 irrespective of population.

As per CPHEEO Manual, the water distribution system for 24x7 water supply is designed with a peak factor of 2.5. The proposed network is modelled for continuous water supply and the consumer consumption pattern considered is shown in Figure-4.1 and Table 4.3 below.

Improvement of Water Supply System in Pallipattu & Thiruvanmiyur WDS Under Area-XIII of Chennai City

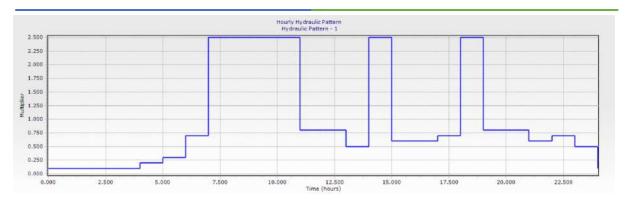

Figure: 4.1: (Hourly Hydraulic Pattern)

Hours	1	2	3	4	5	6	7	8	6	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24

Table-4.3: Hourly Peak Factor Based on Consumption Pattern

4.3.4. Minimum Residual Head at Ferrule

As per the CPHEEO Manual 2023 guidelines (Chapter-2, S.No. 10, Pg. No. 77), the residual nodal pressures at ferrule at highest node shall be 17-21 m for Class I and II cities and 12-15 m for other cities. Considering all aspects, residual nodal pressure at highest node is considered as 17mtr.

4.3.5. Storage reservoirs capacities

As per the CPHEEO Manual 2023 guidelines (Chapter-2, S.No. 12, Pg. No. 79), Balancing capacity of the service reservoir shall be calculated by: (i) mass balance, or (ii) 33% of the total demand of ultimate stage (30 years from the base year) of the OZ of that ESR. In any case, the minimum capacity shall not be less than 33% of the demand as above. However, for rural areas the service tank may be designed for 50% of the ultimate demand. These recommendations have been considered in the design.

4.4. CLEAR WATER TRANSMISSION MAINS

Clear water Transmission Main is the piped network connecting from clear water sump in treatment plant premises to Storage reservoirs in various locations.

Generally peak factor of 1.1 to 1.2 of average demand in consideration of pumping hours is considered for design of transmission main. Economic size of pumping main is carried out according CPHEEO guidelines.

The minimum and maximum design velocity for transmission mains is 0.6 m/s and 2.5 m/s respectively. The minimum velocity is selected to prevent the settlement of grit and suspended matter, and the maximum velocity is selected to minimize erosion of the pipe. Water hammer calculations are done based on the economic size of pumping main.

4.5. CLEAR WATER PUMPING MACHINERIES

The pumping capacity is proposed to supply water from sump to Ground level service reservoirs (GLSR)/ Overhead Service Reservoirs (OHSR's) located in various locations in the project area. 22 hrs, a day pumping operation is considered for lifting water from Sump to GLSR's/ OHSRs. The number of working and standby pumps for single pump operation and multiple pump operation is given below.

- 1 working + 1 standby pumping arrangements (100% standby)– for single pumping operation
- 2 working + 1 standby pumping arrangements (50% standby) for multiple pumping operation
- 3 working + 2 standby pumping arrangements (66% standby) for multiple pumping operation

4.6. SURGE ANALYSIS & RECOMMENDATION OF CONTROL DEVICE

The surge control systems have been designed to ensure that:

- The maximum upsurge with the surge control devices has been restricted to 1.1 times the normal operating pressure.
- The vacuum pressure developed in the pipeline at any place has been restricted to 5 m (minus 5 meters);

The surge protection system in such a case will be in the form of hydro-pneumatics/air vessels/Zero Velocity, air valves or combination of these systems.

4.7. DISTRIBUTION SYSTEM

The distribution system may be by gravity or through pumping with supply from the proposed storage reservoirs (OHSRs/GSRs). Water supply pipelines have been proposed all road corridor up to the plot boundary as per the specific requirements of the consumer.

The piping layout shall follow the planning of the existing roads/streets. To avoid crosscutting of the major roads, especially for house connections and the regular maintenance activities, parallel pipes have been suggested for roads greater than 24 m separated by medians.

4.8. HOUSE SERVICE CONNECTIONS

Service pipes should be laid from the distribution network up to the consumer plot. The service pipe details are summarized as below:

Sr. No	Pipe Material	Diameter	Remarks
1	Mild Density Polyethylene Pipes (MDPE)	15,25 & 40	

4.9. PIPE MATERIALS

Pipe Material for Transmission/Distribution water mains are considered as Ductile Iron (D.I.) pipes and Mild Steel (MS) Pipe. Mild Steel and Ductile Iron pipes will have internal Cement Mortar Lining (CM) lining in accordance with IS 11906 or ISO 4179 and outside fusion bonded epoxy coating for prevention for corrosion.

All consumers service connections shall be MDPE pipes. Wherever MDPE pipeline crosses drains while giving service connections, HDPE pipe encasements are recommended. Details of pipe material, class and standards are given in Table 4.5 below.

Sr. No	Туре	Pipe Material	Class	Standard
1	Diameter up to 1000 mm	Ductile Iron (DI)	K7 /K9	IS 8329
2	Diameter above 1000 mm	Mild Steel (MS)		IS 3589
3	Service Connections	Polvethylene	PE 100, PN 10	IS 4984
4	Crossing for Service Connection	Polvethylene	PE 100, PN 10	IS 4984

Table 4.5: Pipe Material for Transmission/Distribution water mains

4.10. MINIMUM PIPE DIAMETER

The cost of the transmission and distribution system constitutes a major portion of the project cost. It is desirable to adopt the following guidelines (CPHEEO Manual Para 6.6, pg-288):

- (i) In the design of distribution systems, the minimum design velocity should be selected in such a fashion to avoid the deposition at the bottom of the pipe which may result in deterioration of pipe quality.
- (ii) A minimum velocity of 0.4 to 0.6 m/s is recommended to avoid depositions and consequent loss of carrying capacity. However, where inevitable due to minimum pipe diameter criteria or other hydraulic constraints, lower velocities up to 0.3 m/s may be adopted with adequate provision for scouring.
- (iii) The maximum flow velocity should not be more than *2.5* m/s for raw water to avoid the abrasion and subsequent scouring in the pipelines due to suspended particles. However, in case of filtered water, as the quantity of solids (which contribute to the abrasion) is negligible, the maximum flow velocity to be adopted shall be 3 m/s.
- (iv) For hilly area and branch pipe connecting transmission main to service reservoir: The maximum velocity for MS/DI pipes with internal mortar lining shall be limited

to 4.0 m/s for following two cases: a) For hilly regions b) For part of branch pipe connecting transmission main to service reservoir required for dissipation of excess residual head.

- (v) In all hydraulic calculations, the actual internal diameter of the pipe shall be considered after accounting for the thickness of the lining, if any, instead of the nominal diameter or outside diameters (OD).
- (vi) The Head Loss gradient should not exceed 10m/km
- (vii) It is desirable that head loss due to fittings, specials, and other appurtenances are obtained. However, accounting for an individual head loss of each valve and fitting used in transmission mains and water distribution networks (WDN) is not practically possible. Usually, these minor losses are considered as 10% of the frictional losses. In some of the software that are used for the simulation and design of WDNs, there is no provision for a direct increase in friction loss by a certain percentage. Therefore, either the length, flow, or C-value can be modified appropriately. To account for 10% of minor losses, the length of pipes can be increased by 10% or nodal demand can be increased by 5.28%, or the C-value can be reduced by approximately 5%.

4.11. EXCAVATION DEPTH

Excavation may be done by hand or by machine. The trench shall be so dug that the pipe may be laid to the required gradient and at the required depth. When the pipeline is under a roadway, a minimum cover of 1.0 m is recommended for adoption, but it may be modified to suit local conditions by taking necessary precautions. However, the structural strength of the pipe, based on dead load and live load over the pipe, should also be analyzed. The trench shall be so braced and drained that the workmen may work therein safely and efficiently. The discharge of the trench dewatering pumps shall be conveyed either to drainage channels or to natural drains and shall not be allowed to be spread in the vicinity of the worksite.

4.12. PIPE TRENCH WIDTH & BEDDING

Trenching includes all excavation which is carried out by hand or by machine. The width of the trench shall be kept to a minimum, consistent with the working space required. At the bottom between the faces, it shall be such as to provide not less than 200 mm clearance on either side of the pipe. The bottom of the trench shall be properly trimmed to permit even bedding of the pipeline. For pipes larger than 1,200 mm diameter in earth and muroom, the curvature of the bottom of the trench should match the curvature of the pipe as far as possible. Where rock or boulders are encountered, the trench shall be trimmed to a depth of at least 100 mm below the level at which the bottom of the barrel of the pipe is to be laid and filled to a like depth with lean cement concrete or with a non-compressible material like sand of adequate depth to give the curved seating. For details on laying of welded steel pipe, IS 5822-1994, Reaffirmed 2019 may be referred to.

4.13. FRICTION LOSSES CALCULATIONS

The water supply system is designed based on Hazen William friction loss formula as given below. The maximum head loss is maintained below 10 m per km.

$$Q = 1.292 \text{ x } 10^{-5} \text{x C x } D^{2.63} \text{x } \left(\frac{\text{H}_{\text{f}}}{\text{L}}\right)^{0.54}$$

Q = Flow rate (m3/hr),

C = Hazen Williams constant depending upon pipe material,

D = Inner diameter of pipe (mm),

Hf = Head loss (m),

L = Length of pipe (m)

Hazen's Williams Coefficient (HWC) or C value to be used for the pipeline hydraulics shall be based on the design life. The following Table 4.6 presents the recommended C values for design as per CPHEEO Manual (6.5.1.2, Page-281)

Sr. No	Pipe Material	New Pipes	Old Pipes
1	Ductile Iron Pipe (DI) with centrifugally	130	100
	lined with Cement mortar lining		
2	Mild Steel (MS) upto 1200mm with	140	-
	centrifugally lined with Cement mortar		
	lining		
3	Mild Steel (MS) >1200mm with	145	-
	centrifugally lined with Cement mortar		
	lining		
4	High Density Polyethylene Pipes (HDPE)	145	100

Table -4.6- Hazen's Williams Coefficient "C" for design Purposes

4.14. FIRE HYDRANTS & STORAGE REQUIREMENT

Fire hydrants needs to be provided on water network, as per IS 908 (Specification for Fire Hydrant, Stand Post Type). The hydrant shall consist of one or two sluice valves with road surface boxes, a duck foot bend, flange riser and a stand post column fitted with 63-mm male coupling(s).

The hydrants are spaced at a maximum of 100 m center to center as per IS 13039. Fire hydrants shall be provided in spacing around 800 feet (244 meters) as per NFPA Fire Code 2015 Edition.

However, for providing fire-fighting storage, higher provision as recommended by CPHEEO and IS 9668 should be adopted. Additional fire storage is to be adopted within the GLSR/OHSR. The minimum pressure of 14m needs to be maintained within the water network on which the fire hydrants are to be installed. The fire tender has a mounted booster pump capable of boosting the pressure to the required level.

4.15. CONTROL VALVES FOR TRANSMISSION MAIN AND DISTRIBUTION SYSTEM

For operation and maintenance of transmission and distribution system, minimum numbers of valves are necessary. The transmission and distribution mains shall be provided with the following appurtenances and specials as per the following criteria.

4.15.1. Sluice Valves

Resilient seated sluice valve of standard make as per IS 14846 have been proposed at different locations as per requirements to isolate a portion for maintenance.

The distribution system is designed considering DMA formation, and isolation valves will be recommended wherever isolation is required for hydraulic discreteness of the DMA. In addition, valves are recommended to create sub-zones for step tests to identify the leak-prone area.

4.15.2. Non-Return Valve

Non-Return Valves of standard make as per IS 5312 have been proposed at different locations as per requirements to prevent any backflow.

4.15.3. Pressure Reducing Valve

Pressure reducing valves with pressure sustaining override has been provided to reduce the pressure difference between the locations of the same zones. It will also prevent a reduction of pressure beyond a minimum defined value.

PRV might be proposed in specific scenarios where the difference in the residual heads (normally more than 22mm) is critical in terms of operation.

4.15.4. Air Release Valves

Air valves are required at peak points to release entrapped air, admission of air when draining the system and slow release of air during normal operation. Double acting air release valves with EPDM of standard make have been proposed at suitable locations in the rising mains and distribution network to protect the line from both upsurge and down surges. The valves have been provided at a minimum spacing of 400 m. For double acting valves, the valve diameter is generally kept about 1/8th of size of diameter of pipe.

4.15.5. Scour Valves

Scour valves of standard make have been proposed to be installed in the rising mains and distribution system at lower points in the line to drain silt and water from the line whenever required. The discharge generally will be disposed of into a nearby natural stream/valley. All the valves have been enclosed in valve chambers with cover.

4.16. FLOW MEASURING DEVICES:

Flow measuring devices of electromagnetic type are recommended to be provided at all the water distribution stations as these are considered reliable and accurate. The flow totalizer/ computer receives and processes the signal from the transducers. It provides facilities for entering process data connected to the flow measurement and computes and displays the flow. Data such as pipe diameter, pipe material, wall thickness, liquid details, etc., is entered in the flow computer and is stored in its memory. The flow totalizer/ computer displays the flow rate, integrates the flow over a period and stores the flow

trend in its memory. It is possible to achieve about 99.5% accuracy in the flow measurement.

4.17. THRUST AND ANCHOR BLOCKS

Ductile iron pipes with flexible joints will be restrained using concrete thrust blocks in accordance with IS 5330. However, where there are space constraints for construction of standard thrust blocks, a site-specific design is to be adopted, or the joint is to be restrained mechanically using anchored restrained joints.

Concrete thrust blocks have been provided at the bend of the pipes to avoid movement of pipeline as per the requirements.

4.18. WATER DISTRIBUTION HYDRAULIC ZONES & DMAS

The proposed design approach of the water distribution systems incorporated the formation of District Metering Areas (DMAs) for better control and audit of water supply against consumption. Applying zoning via the DMA concept would facilitate monitoring and controlling of the distribution systems in terms of quantities (i.e. water demands), quality (i.e. water quality and residual pressure) and finally resulting in economic return on investment (accurate billing and collection system, reduction in unaccounted for water due to leakage, resulting in financial returns).

Valves have been planned on the boundary of each DMA where pipes are interlinked to adjacent DMA. These valves will generally be kept in closed positions and shall be operated only during emergency conditions. This will help in isolating a part of the area during repairing of leaks or carrying out maintenance, without interrupting the supply to the rest of the DMA. On average 1,000 to 3,000 connections shall be made as one DMA.

4.18.1. Water distribution Modelling Software

Water GEMS software has been used for modelling water distribution networks. The software is comprehensive and easy to use in water distribution modelling applications having Graphic user & GIS interfaces. Water GEMS can be used integrated with ArcGIS or AutoCAD.

4.19. Design Standards:

All designs shall be based on the latest Indian Standard Specifications or Codes of Practice. In addition, the design standards adopted shall follow the best engineering practice in the field based on any other international standard or manuals.

The various referred Indian and International codes & manuals generally used in the design, manufacture and testing of Pipes, Valves, water meters etc. are as mentioned below in Table 4.7 and International Standards relevant to the Water supply system are given in Table 4.8 below.

CHAPTER -5-POPULATION PROJECTION AND DEMAND ASSESSMENT

5.1. Introduction

Population projection and demand assessment has been carried out following the CPHEEO manual published in 2023 and in consultation with CMWSSB officials for adopting appropriate growth rate and water demand figure related to Institutional, Commercial & Industrial consumption. This system encompasses selecting design period, population projection of Chennai city & operational zones under the project area, determination of per capita supply & demand calculation of the project area.

5.2. Design Period

Ultimate design period for the project is 30 years, so the base year has been considered as 2026 with intermediate design year as 2041 & Ultimate design year as 2056 as presented in Table 5.1 below.

1	2026	Base Year
2	2041	Intermediate Year
3	2056	Ultimate Year

Table-5.1: Design Horizons for the project

5.3. Population Projection of Chennai City

5.3.1. Censes data of Chennai city

Decadal census data available for different decades is presented in the Table-5.2.

Table 5.2 Decadal Census data for Chennai City

Sr. No.	Census Year	Population (Lakhs)					
1	1951	14.27					
2	1961	17.49					
3	1971	26.42					
4	1981	32.84					
5	1991	38.43					
6	2001	43.44					
7	2011	46.47					

5.3.2. Population Forecasting Methods and Projected Population

Population forecasting for the Chennai city for the base year 2026, intermediate year 2041 and ultimate year 2056 has been carried out by various methods such as arithmetical, geometric, incremental, decadal growth and semi-graphical methods and the forecasted population figures are presented in Table 5.3 below.

	Projected Population in lakhs as per various method for City									
S. No	Year	Arithmetic Progression Method	Geometric Progression Method	Incremental Progression Method	Decadal Growth Method	Semi Graphical Method				
1	2026	55	60	55	51	51				
2	2041	64	78	64	57	59				
3	2056	73	101	73	63	68				

 Table 5.3: Projected Population by various methods for Chennai city

According to the report of "Selection of experts and supporting staff for the Project Implementation Unit, Chennai Metropolitan Development Authority under the Tamil Nadu Housing and Habitat Development Project", the CMA region comprises of Chennai city and the rest of CMA. Chennai city alone shared 74% of the total population of CMA in 1971. In 2021, It is estimated to share 46% of the CMA. The Chennai city registered a growth rate of 1.23% in 1991 -2021 to 0.68% during the period 2001-2011, ranked the second least decadal change among the districts. The Chennai City Corporation with an area of 176 sq. km. witnessed a population of nearly 4.65 million in 2011. In October 2011, the City area was revised to 426 Sq.km, with a population of about 6.6 million (2011). The workforce participation rate was 43.3%, indicating that nearly 3.68 million people are employed in CMA. Chennai is a major transportation hub for road, rail, air, and sea transport connecting major cities inland and abroad.

After comparing the population figures arrived by different methods and thread bare deliberations with CMWSSB, decadal growth method has been adopted with a growth rate of 6.80% per decade for design of the water supply system.

5.4. Projected Population for Operational Zones

Population has been estimated for individual operational zone by decadal growth method. An abstract of projected population is presented in below Table 5.4.

Name of the WDS	Operational Zone (Depots) Number	Population Projection @ 6.80% of Decadal Growth Rate						
	Number	2026 (Base Year)	2041 (Intermediate Year)	2056 (Ultimate Year)				
Pallipatu WDS	170	69276	76689	84895				
	173	51185	56662	62725				
	174	47615	52710	58350

Table 5.4: Projected population Details of WDS and its Operational Zones

5.5. Per capita Supply for Demand Calculation

Water supply demand calculation has been done considering per capita supply for domestic, industrial/commercial, floating population, fire water demand, permissible losses in accordance with CPHEEO manual as presented in Table 5.5 below.

S. No.	Particular	Rate		
1	Domestic Demand @ 150 LPCD	150 LPCD		
2	Institutional Demand As per Actual	As per Actual		
3	Industrial/Commercial Demand As per Actual	As per Actual		
4	Fire Demand As Per Amrut 2.0 Guideline @100√P	Calculated		
5	Floating Population Demand @ 2% of Domestic Demand	3 LPCD		
6	Distribution Losses @10%	15 LPCD		
*	Total Clear Water Demand as per calculation sheet	As per Calculation, in table 5.6		

Table 5.5: Per capita Water supply considered for different uses

5.6. Demand calculation for WDS and it's Operational Zones

Demand for the design horizon years has been calculated for individual operational zone based on per capita supply and projected population. An abstract of demand calculated is given in the below table 5.6. Referring the table, the design water demand for the project area in the base year 2026, intermediate year 2041 and ultimate year 2056 is 50MLD, 55.56 MLD and 61.58 MLD respectively. Detailed calculation is appended in Appendix 4.

CHAPTER -6-PROPOSED WATER SUPPLY SYSTEM

6.1. Introduction

This chapter covers adequacy check for the water supply source, design of transmission mains, storage system, pumping systems, operational Zone, DMA & Lane/ sub-lane formation, distribution network design using Water Gems hydraulic modelling software, house service connections, domestic metering aspects and instrumentation, control and automation of the proposed water supply system.

6.2. Sustainability of Proposed Source

It is proposed to use the Nemmeli DSP with a capacity of 100MLD for the water supply to the project area considered under Area XIII. As per demand assessment carried out at Chapter 5, the total quantity of water required for base year (2026) is 50 MLD, for Intermediate year (2041) is 55.56 MLD & for ultimate year (2056) is 61.57 MLD. At present Nemmeli treatment plant is producing 90 MLD which is sufficient to meet the water demand of 50MLD, 55.56MLD and 61.58MLD in the base year (2026), intermediate year (2041) and ultimate year (2056) respectively.

6.3. Design of Transmission Mains

Economic sizing-based design of the existing Transmission mains have been carried out for all the eleven stretches for the ultimate design period i.e. for year 2056. It is found that additional parallel pipes are required to be laid in six stretches, whereas in five stretches, the existing mains are adequate. The Transmission Mains are designed for the system to meet required supply and flow for all WDS, except Ekkathangal WDS, under Area XIII. However, cost of transmission additional transmission mains system is not covered in the present proposal due to funding constraints. An abstract of economical pipe diameter designed is shown below in Table 6.1. Schematic diagram of the proposed transmission network is shown at Figure 6.1 below.

6.4. Design of Storage system

The project area covers two WDS for supply of water to seven operational zones, six under Pallipatu WDS i.e. OZ-169(P), OZ-170, OZ-173, OZ-174, OZ-178, OZ-179 & one operational zone under Thiruvanmiyur WDS i.e. OZ-180. The existing and required storage capacity of WDS are given in below table 6.2. The required capacity is estimated as per CPHEEO manual Guidelines.

	Storage capacity Details									
Sl. No.	WDS Name	Present Required Storage Storage Capacity @ 33% in MLD		Required Storage Capacity as per mass balancing MLD	Storage Capacity Deficit / Excess					
		Capacity in	2041	2041	As per	As per Mass				
		MLD, 2023	(Intermediate Year)	(Intermediate Year)	CPHEEO (33%)	Balancing				
	А	D	F	G	H=D-F	I=D-G				
1	Pallipatu WDS	17	14.56	11.925	2.44	5.075				
2	Thiruvanmiyur (New) WDS	3	3.77	3.1	-0.77	-0.1				

Table 6.2: Adequacy Check for Storage System

Table 6.2.1: Storage Capacity Analysis

	Storage capacity Details									
Sl. No.	WDS Name	Present Storage	Storage Capacity Deficit / Excess							
		Capacity in ML, 2023	As per 33%	As per Mass Balancing						
1	Pallipatu WDS	17	14.35%	29.85%						
2	Thiruvanmiyur (New) WDS	3	-25.67%	-3.33%						

The existing storage reservoir capacity of Pallipatu WDS is 17 ML and the requirement of reservoir for the intermediate design year is 11.92 ML and as per CPHHEO guideline, storage reservoir capacity is in excess by 14.35% & as per Mass balancing storage reservoir capacity is in excess by 29.85%

The existing storage reservoir capacity of Thiruvanmiyur WDS is 3 ML and the requirement of reservoir for the intermediate design year is 3.77 ML & as per CPHHEO guideline, reservoir storage capacity is meagre by 25.67% & as per Mass balancing, reservoir storage capacity is meagre by 3.33%. As the deficit in Mass balancing exercise, it is coming 3.33%, considering space constraints no additional is proposed. Details are presented in Table 6.2 above.

6.5. Pumping System Design Details

Pumps are designed to provide water from WDS to the operational zones. Pumping system/arrangement consists of six pumps (4+2) i.e four working and two standby pumps for Pallipatu WDS. The distribution branch lines will be provided for each operational zone. Similarly, Pumps designed for Thiruvanmyur WDS will consist of three pumps (2+1) i.e.; two working and one stand by.

Details of pumping system for water supply to each Depot is given in Table 6.3 below.

Table 6.3: Details of Pump sets

Improvement of Water Supply System in Pallipattu & Thiruvanmiyur WDS Under Area-XIII of Chennai City

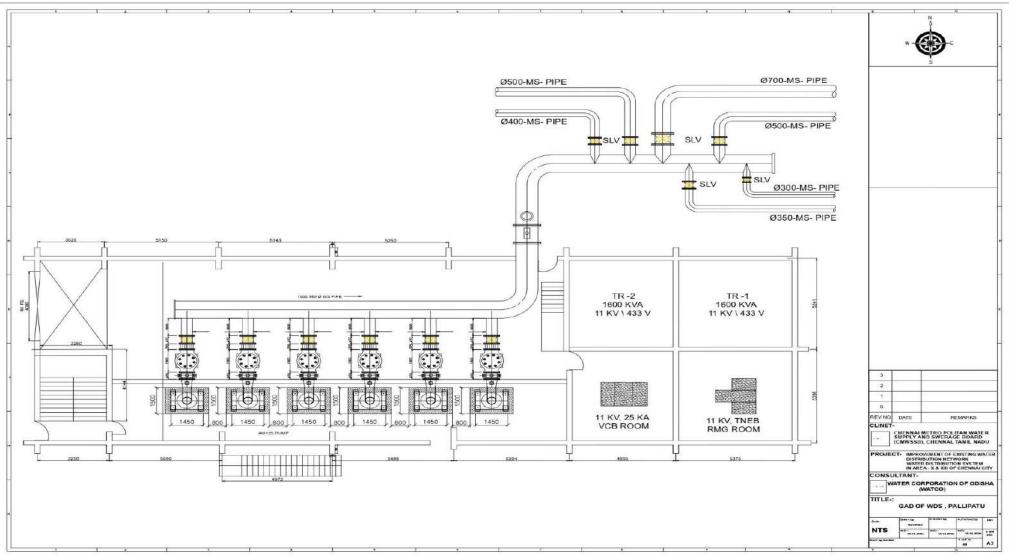

Figure 2 General Arrangement of Pumps in Pallipatu WDS

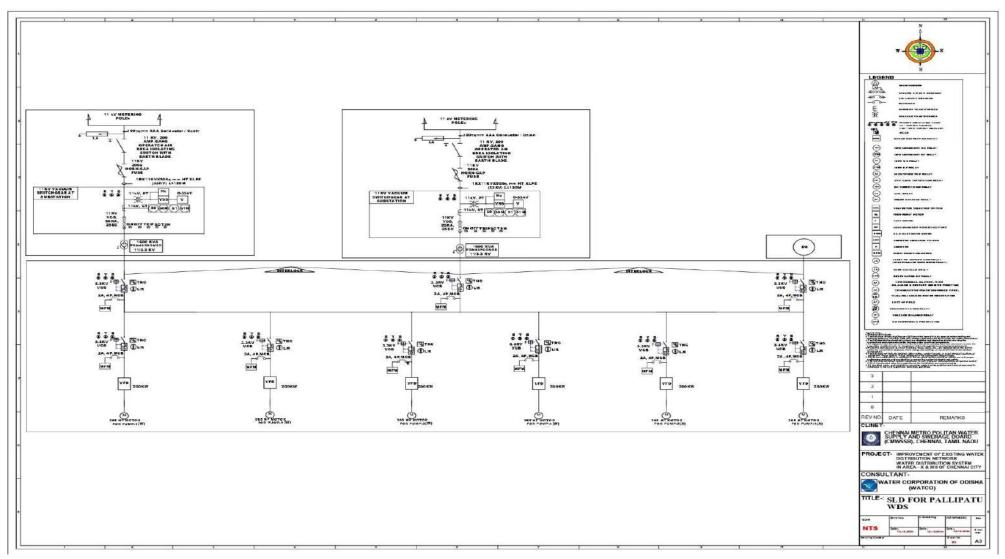

Figure 3 Single Line Diagram for Power Supply of Pumps at Pallipatu WDS

6.6. Defining Operational Zones

There are in total of seven operational zones covered in this DPR, out of this, six operational zones are supplied by Pallipatu WDS namely OZ-169(P), OZ-170, OZ-173, OZ-174, OZ-178, OZ-179 & one operational zone is supplied by Thiruvanmiyur WDS namely OZ-180. Zone boundaries are finalized accordingly and given in Table 6.4.

The above zone boundaries have been frozen based on the following considerations to achieve minimum pressure of 17 m at peak hours of the day. The following considerations have been made to finalize the operational zone boundary.

- Divide the area into zones based on elevation to ensure adequate pressure in high areas without causing excessive pressure in low areas.
- Storage capacity of existing WDS.
- Feasibility of crossing canals and rivers.
- Ensure the zoning allows for flexibility to accommodate increased demand or system changes
- Residential, commercial, and industrial areas may have different water usage patterns and might benefit from separate zones.
- Separate the residential and industrial areas into different zones due to their differing water usage patterns.
- Use natural boundaries like rivers and highways, or major roads to define zone edges.

Detail of Proposed Operational Zones							
Sl. No.	Name of the WDS	No. OF Operational Zones, Proposed	Operational Zone Name				
1	Pallipatu WDS	6	OZ-169(P), OZ-170, OZ-173, OZ- 174, OZ-178 & OZ-179				
2	Thiruvanmiyur (New) WDS	1	OZ-180				

Table 6.4: Proposed Operational Zones

6.7. DMA Demarcation and Hydraulic Modelling for Distribution System:

A District Metered Area (DMA) is a subzone within the operational zone of a water distribution network that can be hydraulically isolated and for which water consumption is measured using water meters. Bulk flowmeters are installed at the entry points of the DMAs, and all user connections are properly metered for recording the consumption. The main purpose of DMA is to identify and priorities leak identification and repair programme by computing NRW values. Another important purpose of DMA is to rationally distribute the water according to the needs with equal pressure. A typical hydraulically discrete single DMA is shown in Figure 6.2.

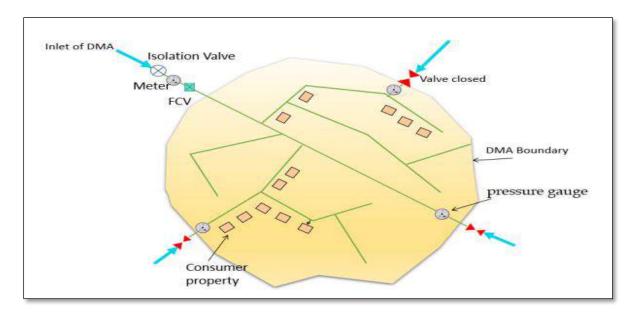

Figure 6.2: Typical hydraulically discrete single DMA

Each Operational Zone is divided into number of DMAs, considering easiness of operation, control & monitoring of DMAs with number of house connection between 250-1000. Each DMA can be isolated during breakdown without affecting the water supply of other areas. 97 DMAs have been proposed under Pallipatu WDS and 28 DMAs under Thiruvanmiyur (New) WDS as presented in Table-6.5 below. And numbers of households per DMA is presented in table 6.5A below.

Detail of Proposed No. of DMAs								
Sl. No.	Name of the WDS	No. OF DMAs, Proposed						
1	Pallipatu WDS	97						
2	Thiruvanmiyur (New) WDS	28						
	Total	125

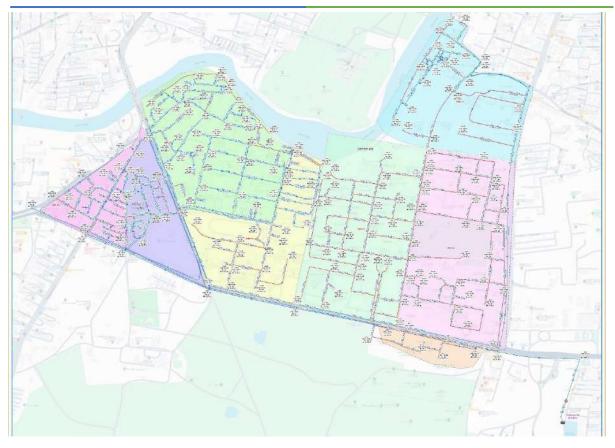

Figure 6.2A: DMA Model

6.8. Design of Distribution System

Hydraulic modelling has been done after optimization of distribution system considering velocity of flow, head loss and verification of residual heads at ferrule points of min 17mt. The network is analysed taking into consideration the design standards, design manuals and field practice. The existing distribution network is modelled considering that utilization of existing system by optimization and adding new pipes & other required components to provide adequate water supply to the Operational area. In the proposed network, provision have been made for pumps with VFD, flow control valves, pressure regulating valves to maintain pressure in the distribution system, regulating flow of water for equitable distribution of water, and for isolation purpose during repair and maintenance. Depending of water supply demand of each Operational zone, water reservoir capacities has been worked out and cross verified with available storage capacity.

Following assumptions are made while carrying out hydraulic model:

- The existing storage capacity of Pallipatu WDS & Thiruvanmiyur WDS of 17 ML & 3 ML respectively, with continuous pumping to the distribution system is used as supply Unit.
- Maximum utilization of existing network is considered.
- Minimum pressure considered is of 17m at ferule point of consumer connection.
- Roughness co-efficient C value for new pipe is 130 and 100 for existing pipe (Old).

- Minimum 100 mm dia DI K7 is considered.
- Minimum velocity at peak flow is 0.6 m/s except dead end pipes
- Maximum head loss of 5 m per km

6.8.1. Peak Factor considered in the design

As per CPHEOO Manual, for water distribution system for 24x7 water supply, the design peak factor shall be 2.5. The proposed network is modelled for continuous water supply and the consumer consumption pattern considered is presented in figure-6.3 and Table 6.6 below.

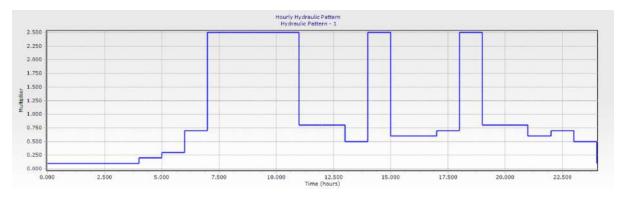

Figure 6.3: Hourly Hydraulic Pattern

Table 6.6: Hourly Hydraulic Pattern

Hours	1	2	3	4	5	6	7	8	6	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24

6.8.2. Simulated Hydraulic Model

From present intermittent water supply, the network will be upgraded to 24 x 7, continuous drink from tap quality water supply. On an average,150 LPCD of water shall be supplied to the consumers. In the proposed upgraded distribution network, the operational zones will have full coverage containing all consumers. Designed population of operational zone is distributed on pipeline length as per house level survey data and the design population data is adopted to design the distribution network. Open Flows Water GEMs, a Bentley m proprietary software for hydraulic modelling was used for the Project.

The simulated hydraulic model results in the form of graph with relation of pressure and demand for 24 hours is presented below. The graph of simulated model at Figure 6.7 shows variation of demand and pressure on hourly basis.

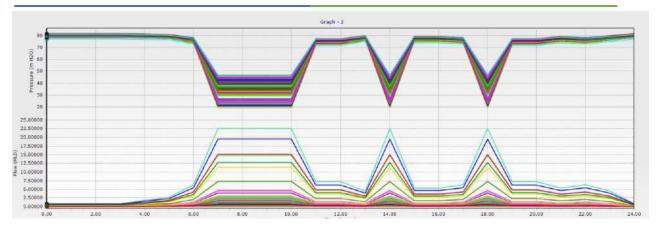

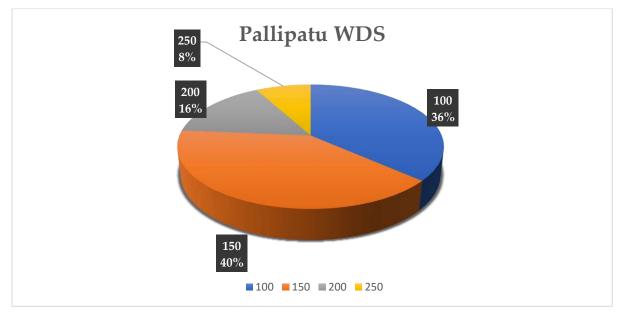

Figure 6.4: Graph showing Simulated Hydraulic Model

6.8.3. Summary of Pipeline Diameter and Length as per design

Based on the hydraulic modelling, operational zone wise network details showing existing pipeline to be retained, replaced & newly proposed pipeline is presented in Table-6.7 & 6.8 for Pallipatu & Thiruvanmiyur WDS operational zones respectively.

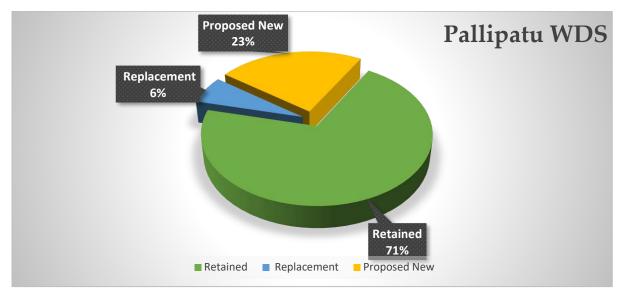

Referring table 6.7, for Pallipatu WDS Operational Zones, it is revealed that out of 246 KM existing pipeline network, 20 KM (8% of total length of pipeline) needs to be replaced due to poor condition & inadequate size of diameter. Out of total replacement pipeline length for lower diameter pipeline 100 mm & 150mm stands at 37% & 40% respectively whare as percentage of replacement pipeline for 200mm & 250mm is 16% and 7% respectively. Hence replace of lower diameter pipeline consist about 77% of the total replacement of pipeline. Pictorial Pie Chart is presented below for better appreciation.

Replaced 24X7 Water Supply from Pallipatu WDS distribution Network diameter wise percentage Pie Chart

Desi	gned Distri	bution Pipe De	tails, Supply	from Pallip	atu WDS

Operation Zone wise detailed pipe abstracts & Hydraulic Model Simulation Results (Pipe and Junction Tables) are attached in Appendix 5.

6.9. House Service Connection:

House service connection is most vulnerable point of leakage. In order to achieve leak proof house connections, all house connections are proposed with saddle and compression fittings. At the Consumer end, AMR flow meter shall be installed, concealed and enclosed in box, with an isolation valve.

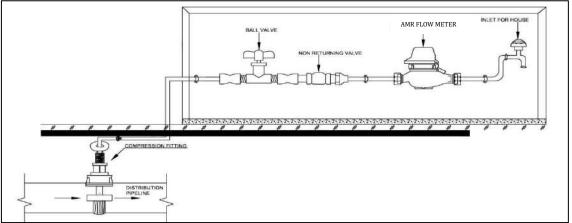

Figure 6.5: Sample House Service Connection Details

Proposed House Service Connection consists of following,

- Compression Fitting
- Pipe Material used: MDPE & UPVC
- Ball Valve
- Non-Returning Valve

6.10. Automation Design Philosophy and Overview

Pumping is made from DWS to the distribution network system of each depot. The pumps will be operated through VFD controller for Controlling and regulating the pressure in the water supply network.

Each Depot is provided with a flow meter in outlet, with a motor operated flow control valve and pressure transmitter. Control panel of the PLC / SCADA system is installed in pumping station to control the pumps with respect to field demand inputs received from DMA & Lane/Sub-Lane. The SCADA generates the data, which sends the data to command centre through cloud service. This data is accessed by the digital twin software on cloud.

The identified Key locations at the entry of each DMA and the strategic spots such as highest and lowest ground elevations and farthest node in the operational zones. PLC

panel will provide localized communication through OFC between the Pumping station and sub-DMA panel. The control and monitoring elements should further be enabled to communicate the status of their individual locations to an IoT based centralized monitoring and control centre. The power will fetch from the electricity service provider with DG as power back-up.

The hydraulic design for each Lane location is fixed to control through PLC/RTU panel with localized communication through OFC between the DMA and RTU panel of Lane. The control and monitoring elements should further be enabled to communicate the status of their individual locations through wireless network to command centre. The power will fetch from the service provider with DG as power back-up.

Each defined Sub-Lane is controlled through RTU (Remote Terminal unit) based control panels with accessories and power supply from Lane panel with battery backup shall be installed along the Street. The RTU panel are transmit the data through wireless network to Data centre.

The AMI enabled or AMR Water meters will be installed near the property boundary of domestic consumers. The add on component with sim card & battery has to be installed within the life span (5 years) of water meter. The AMR meters are of three types, AMR, Walk-by AMR and GPRS AMR. Meter Data Acquisition System is to read meters through Android based application. The communication between Meter Data Acquisition System and field data collection device or any gateway should be through cellular network.

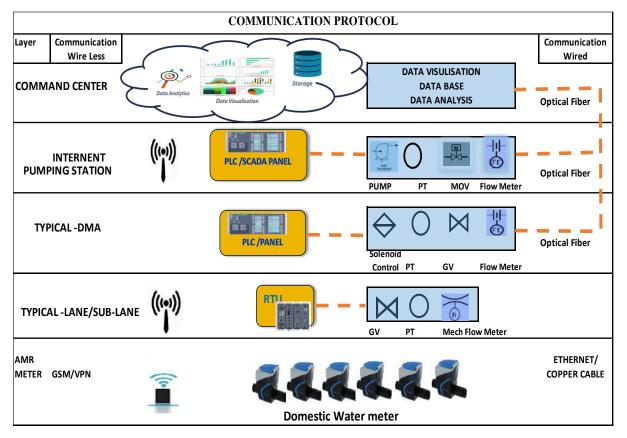

Figure 6.6: Typical System Architect

Component wise details are described in Following Paragraph:

a) Command Centre

Comprehensive data on flow & pressure of water in feeder and distribution network will allow us to control and regulate the water Supply system. This will provide a fair idea about the water demand area wise inside the city. It also helps to monitor real-time values of concentration of residual chlorine in any pipe at any point of time. 100% Consumer metering and telescopic tariff based on volumetric measurement curbs wastage of water as excess and unnecessary consumption becomes costly for consumer. Thus, demand management which reduces NRW. The redressal of complaints is monitored online for compliance of complaint.

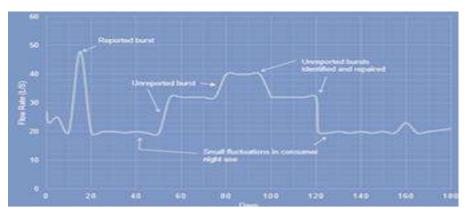

Figure 6.6: Typical System Architect

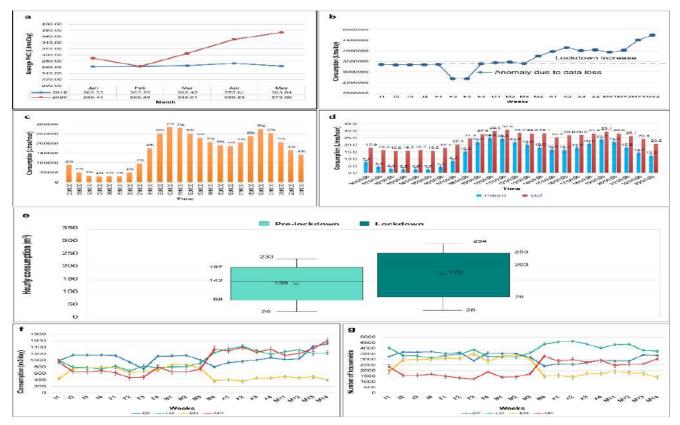

Figure 6.7: Typical data analysis of a DMA

a) Pumping Station

The Schematic sketch of water pumping systems with VFD controller pressure Transmitter, electromagnetic flowmeter, quality analysers. Control panel of the PLC/SCADA system and the electrically controls of actuators shall be installed at a suitable ground location. Supervisory control and data acquisition or SCADA is a type of process control system architecture that uses computers, networked data communications, and graphical human-machine interfaces (HMIs) to enable a highlevel process supervisory management and control. Plant floor devices such as pumps, valves, and transmitters transfer real-time data to processors such as remote terminal units (RTUs) or programmable logic controllers (PLCs). That data is then disseminated to various devices within the network such as HMI terminals, servers, and computers. Images of these processes are presented to operators for various types of interaction.

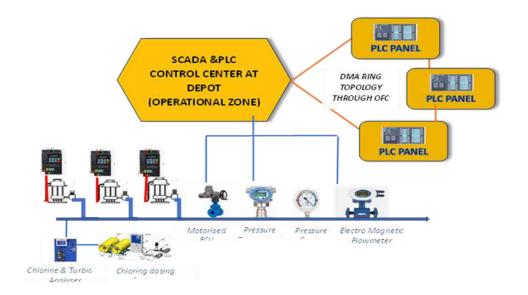

Figure 6.8: Typical Instrument of Pumping Station

b) DMA

A sketch is shown for PLC panel of DMA with communication through OFC between the sub-DMA panel. The control and monitoring elements should further be enabled to communicate the status of their individual locations to an IoT based centralized monitoring and control centre. The power will fetch from the service provider and DG as power back-up.

Figure 6.9: Typical Arrangement of Equipment of At DMA

Equipment for Each DMA

Figure 6.10: Equipment of At DMA

c) Lane/Sub-Lane

The typical drawing for Sub-DMA with communication through OFC between the RTU panel of Lane. The control and monitoring elements should further be enabled to communicate the status of their individual locations to an IoT based centralized monitoring and control center. The power will fetch from the service provider with DG as power back-up.

6.10.1. Smart Water Management Operational Philosophy

Smart water management systems capitalise on the application of technology to improve water allocation, support efficient water usage and drive the overall sustainable management of water resources. These systems collect, simulate and process data to optimise decision-making processes. A smart pipe is designed as a module unit with capacity for the installation of sensors allowing for the real-time monitoring and automatic detection of flow, pressure, leaks and water quality as well as without changing the operating conditions of the hydraulic circuit. An actuator is hardware through which the analysed data from the sensors are used to perform the resultant action of the water system.

The main advantages are the continuous monitoring of the network without local operator intervention and with the low energy consumption of the wireless sensor.

Main benefits

- Improve water allocation
- Support efficient water usage
- Increase water security

Potential benefits

- Reducing operation costs
- Improving energy usage efficiency
- Promoting sustainable behaviour
- Enhanced data collection

Mandatory functions

Enhance the efficiency of water systems

Such as use of devices to detect water pressure, flow, etc to allow for early leakage detection, pipe damage, and other infrastructure maintenance issues. Consequently, faster execution of repairs, maintenance and general operational efficiency will minimise risks and offer investment protection.

Support easy access and fast processing of information

Such as smart metering provide access to real-time data related to water and associated energy consumption allowing opportunities to have a greater

understanding of consumption (driving behavioural change), ability to integrate consumption data into smart networks for efficiently improvements as well as support the responsibilities and capacity of water service providers.

Enhance customer experience

With greater billing accuracy, portal apps for utility customers and improved infrastructure and supply, customers are expected to experience an improvement in water delivery service.

Potential functions

Improve water quality

The use of sensors and IoT technology facilitate real-time monitoring and control of water quality. Therefore, the entry of pollutants in water systems can be easily and quickly detected and addressed before reaching customers.

Enhance environmental protection

The water savings expected with more precisive metering, monitoring and management will reduce the financial, environmental and social cost associated with water abstraction processes.

Generate new forms of governance

The large volumes of data expected with smart water networks may generate many opportunities for app developers and private citizens that change the trajectory in which water is managed.

6.10.2. Smart Water Metering through AMR & AMI

Smart Water (Electromagnetic/Ultrasonic) Metering System is proposed to reduce the challenges currently faced in the water sector. Information and communication Technologies (ICT) play a major role in Smart Water Metering System, which includes data acquisition and integration using Electromagnetic/Ultrasonic water meters, data distribution using wireless communication, data processing and storage using web-based tools.

RF based communication enables the automated meter reading functions that have been typically accomplished through manually intensive operations, including water meter readings, identifying tamper in the field, etc. AMI & AMR are both based on RF communication.

AMI is the collective term to describe the whole infrastructure from Electromagnetic/Ultrasonic Water Meter to communication network to control centre equipment and all the applications that enable the gatherings and analysis.

AMR is the data collection system where the meters are read automatically when the meter reader either walks-by or drives-by the meter installation area.

The large volumes of data expected with smart water networks may generate many opportunities for app developers and private citizens that change the trajectory in which water is managed.

6.10.2.1. Proposed Smart Water Metering System

In the proposed solution, AMI network will be designed in such a manner that multiple Gateways will cover each meter & fetch the meter data, thereby building redundancy. Each gateway will forward the received packet from the end node to the cloud-based network server via some backhaul (either Cellular, Ethernet). The intelligence and complexity are pushed to the network server, which manages the network and will filter redundant received packets, perform security checks, schedule acknowledgments through the optimal gateway, etc.

6.10.2.2. System Architecture:

Smart water metering systems incorporate AMI/AMR and other advanced systems to manage urban water supplies more effectively. These systems integrate physical infrastructure with digital technologies to create a responsive and efficient network.

The system consists of the below components:

- 1) Smart (Electromagnetic/Ultrasonic) water meters
- 2) Walk-by/Drive-by System
- 3) AMI Gateways
- 4) Meter Data Acquisition System
- 5) Android Apps
- 6) API to integrate

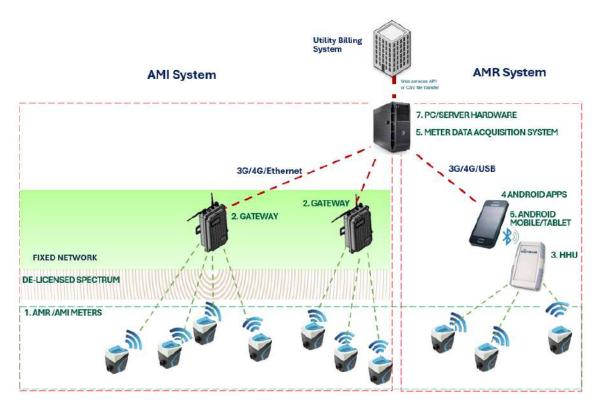

Figure 6.13: Overview of System Architecture

Detailed Project Report

6.10.2.3. Smart water meters:

Electromagnetic and Ultrasonic water meters have inbuilt radio for AMI/AMR communication capability over unlicensed frequency. Installed at consumer endpoints and other strategic locations, these smart water meters serve as the backbone of the smart water metering system. They are used to track water usage, help identify leaks, and provide data log to study the consumption patterns. The meter data is encrypted & securely transmitted to the AMR & AMI system.

The meter shall be suitable for communicating over the AMR & AMI system so that the AMR can be used as a back-up for AMI, in case the meters are not read over AMI due to some unforeseen reason. There should be no need to revisit or configure the meter to switch from AMR to AMI or vice-versa.

Advantages of Electromagnetic and Ultrasonic meters:

- These meters are with no-moving-parts, no strainer required, hence require no maintenance.
- No-moving-parts found in the Electromagnetic and Ultrasonic meters also allows for these meters to be installed in virtually any orientation. This allows increased flexibility as to where the meters can be deployed, and results in less space required for meter installation.
- These Electromagnetic and Ultrasonic meters incorporate solid-state electronics and long-life batteries to support the required power consumption. Manufacturers provide assurance for the operational battery life of 15 years under standard operating conditions & the meters are with warranty for 12 years.
- The meters provide wide operating flow range Ratio (Q3/Q1) 500:1. Hence suitable for measurements of consumption at very low flow to high flow. This helps in NRW reduction.
- The accuracy of the meters is sustained for the life of the meter.
- No air measurement.
- Low pressure Loss
- U0D0 no upstream & downstream length required
- Composite body has no scrap value hence avoids theft

Highlights of the Features of Electromagnetic/Ultrasonic water meter:

- Approvals and Certifications:
 - MID certified meters & meter manufacturing plant
 - o ISO9001, ISO14001, ISO45001, ISO50001 certified meter Manufacturer
 - o IP68 certified Electromagnetic/Ultrasonic water meter
 - Endurance certified meter from FCRI
 - Flowrate & Dimensions:
 - Dynamic Ratio (Q3/Q1): Minimum of 500:1

6.10.2.4. Walk-by/Drive-by AMR:

In case of data collection through the gateways is missed for some house connections, a backup data collection system is proposed with

Walk-by/Drive-by AMR, which is an Automatic Meter Reading (AMR) system that uses handheld reading units to collect data from meters. The meter readers carry handheld unit with a transceiver & an android device to collect readings as they walk or drive by the meters. The meter readings can then be remotely transferred to the Control Centre over cellular (3G/4G) network.

Advantages:

- Faster & easier meter reading
- Accurate meter reading
- Faster resolution of Billing disputes

6.10.2.5. AMI System:

AMI system consists of Electromagnetic/Ultrasonic Water Meter read using Gateway communication system. This data is then sent to control centre and all the applications that enable the gatherings and analysis in near real-time automatically without any manual intervention. The objective of AMI is remote meter reading for error free data, load profiling and analysis of data.

6.10.2.6. AMI Gateways:

Gateways are typically mounted on utility poles, rooftops, or on top of water tanks.

Depending on the vendor and local operating conditions, they may be configured to use alternating current (AC) electrical power or direct current (DC) solar panel cells.

Transferring information from Gateways to the AMI/AMR control facilities (referred to as backhaul) requires a wide area network (WAN). AMI vendors do not typically provide the WAN. Instead, they work with the utility to identify and use locally provided telecommunications facilities. Backhaul may be accomplished over any of several wireless communications systems, including cellular (3G/4G). Backhaul can also be provided over Ethernet.

With current water utility AMI systems, the amount of data being passed in a given time period is not high, so not much bandwidth is required.

Backhaul over commercial networks such as cellular service will generally require monthly service charges.

Highlights of the Technical Features of Gateways:

- Equipment Type Approved by WPC
- UV Resistant Housing
- Operating Temperature -20 °C to +70 °C

Advantages of AMI system:

- Faster & easier meter reading
- Accurate meter reading
- Faster resolution of Billing disputes
- Granular data available
- Early Alarms to identify possible tamper

6.10.2.7. Meter Data Acquisition System:

Software application in the AMI/AMR Control Centre used to acquire data from meters via communication network both the walk-by/drive-by AMR and the AMI system.

Meter Data Acquisition system must have a capability to collect and process meter reading manually (for Non AMR meters) & RF (radio frequency) in drive by/walk by mode or through any fixed network communication. Meter Data Acquisition System must have capability to read meters through Android based application. The communication between Meter Data Acquisition System and field data collection device or any gateway should be through cellular network.

Figure: Dashboard Analysis through GIS

The proposed Electromagnetic / Ultrasonic AMR / AMI Water Meter Solution will provide CMWSSB the reliable, robust system. This will help CMWSSB to monitor and manage the individual consumer consumption and will help to provide equitable water to their consumers. The proposed meter comes with 15 years warranty with low maintenance. This system will enable CMWSSB to reduce losses, increase operational efficiency and improve revenue.

6.11. Instrumentation, Control and Automation

This clause covers Instrumentation, control and automation starting from Pump House level, DMA level, lane/sub-lane level along with communication system PLC and SCADA.

6.11.1. Instrumentation and Control System at Pump House

Following Instruments are proposed within Pump house. Presented in figure 6.14 below,

- Butterfly Valve with feedback,
- Vertical Inline pump with motor,
- Pressure Gauge,
- Electromagnetic Flow Meter,
- Motor operating valve,
- Discharge Manifold.

6.11.2. Instruments are proposed outside pump house:

- Bulk flow meter
- Pressure Transmitter.

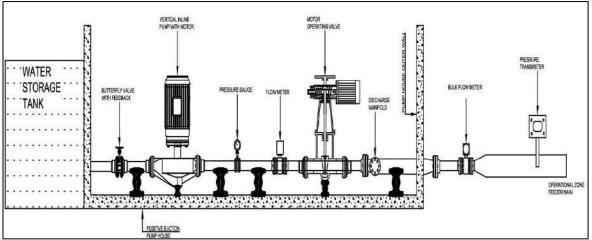

Figure-6.14: WDS Pumping arrangement with Instruments

6.11.3. Operational Zone to DMA entry arrangement

Feeder line shall be laid and at entry point of each DMA. ADMA control unit is to be installed which will transmit data to server by OFC cable which will be laid along the length of pile line from DMA Control unit to server. DMA level control unit is presented at Figure 6.15 below.

DMA control unit comprise of Isolation valve, electromagnetic flowmeter, solenoid valve, pressure gauge and pressure transmitter.

Control Unit at DMA entry consists of following instrument mentioned below,

- DI Double Flange resilient seated glandless gate valve
- Electro Magnetic Flow Meter
- Double Chamber DI Control valve, Hydraulic Operated 24 V DC, Solenoid control, IP 68, Integrated with PLC panel,
- Pressure Gauge
- Pressure Transmitter

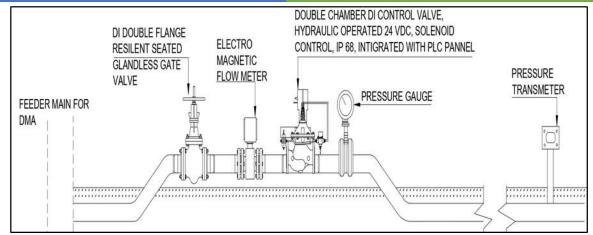

Figure-6.15: DMA level Control Unit

6.11.4. DMA to Lane/sub-Lane:

From DMA to Lane and Sub-Lane, to distribute adequate water with required pressure, and for better control on water audit, Lane-Sub-lane control unit shall be installed at start of lane. This control unit will comprise of isolation valve, basket strainer, Flow meter, Air valve, Globe valve & pressure transmitter. The data will be communicated to server by GSM signal. As presented in figure 6.16 below.

Control Unit at Lane/Sub Lane entry, it is consisting of following instrument mentioned below,

- Flow Meter
- Basket Strainer
- Air Valve
- Globe Valve

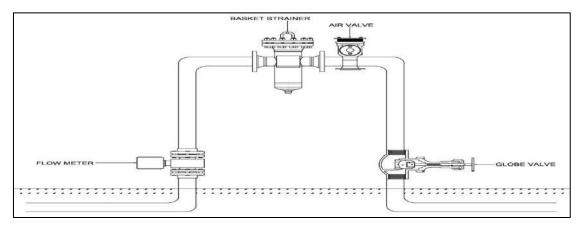

Figure-6.16. Lane/Sub Lane Control Unit.

6.12. Assumptions Made for Hydraulic Modelling

The isolation valve, meter, and the flow control valve (FCV), at the entry point of the DMA, should be connected to the SCADA/IoT.

6.12.1. Key points in Distribution System

Every water supply distribution system has some key notes where it is important to measure various parameters such as pressure, flow, water quality to ascertain that the water supply system is working within normal and permissible limits.

Key locations are identified, generally at the entry of each DMA and the strategic spots such as highest and lowest ground elevations and farthest node in the operational zones. The above-mentioned parameters feedback from predefined locations are key for proper functioning of the overall system. Over a period, these key points may lose / gain importance for parameter measurement in the overall water supply system.

6.12.2. DMA Operation Controls:

- Setting supply pressure at DMA inlet point.
- Controlling isolating valves to control supply in case of failure or shortage or to manage supply for sub-DMAs in case of intermittent supply.

This information is used to score DMAs based on their situation, set targets, and prioritise activities.

6.12.3. Monitoring DMA inflows and pressures:

- Monitoring DMA inflows and pressures are used for calculation of the following.
- System input volume (SIV).
- Minimum night flow (MNF).
- Supply pressure at inlet point and at critical and average pressure point of the DMA.
- Online bottom-up water balance including leakage, water demand estimation.
- Detection of bursts events.

Water loss performance Indicators: including leakage per service connections / per length of pipes, and the infrastructure leakage index (ILI).

6.12.4. Monitoring of NRW in 24×7 Water Supply System

The purpose of DMA formation is to monitor the water supply into DMA and measure the consumption of water at household level to monitor and control NRW in a gradual manner. This will also facilitate to conduct regular water audit and take measures to bring down the NRW to the desired level. In order to monitor the NRW at DMA level, the prerequisite is to provide flowmeter at the entry of DMA and 100% House service connections with water meters and proper communication technologies. The frequency of monitoring of NRW and accuracy depends on the type of water meters and communication technologies adopted in the 24×7 water supply distribution system at DMA level.

6.13. SMART WATER MANAGEMENT

Smart water management is the use of data and technology to optimize water usage, reduce waste, and improve overall efficiency. IoT systems can play a critical role in smart

water management by providing real-time monitoring and control of water systems. Here are some examples of how a cloud-based IoT system can be used for smart water management:

- Real-time Monitoring: A cloud-based IoT system can monitor water systems in realtime, including water quality, flow rates, pressure, and other key metrics. This can provide valuable insights into system performance and enable early detection of issues before they become significant problems.
- Remote Control: A cloud-based IoT system can provide remote control of water systems, enabling operators to adjust system settings, turn pumps on or off, and monitor performance from anywhere with a secured internet connection.

6.13.1. Monitoring

The control systems and all the above subsystems would comprise PLC / RTU based control panels with accessories and relevant switchgear as per the system requirement that can be programmed to operate the control systems in a pre-programmed fashion. In addition, as required and as per site conditions, the PLC /RTU panels will have the capability to provide localized communication on technologies such as OFC, ethernet, LoRaWAN, etc. The control and monitoring elements should further be enabled to communicate the status of their individual locations to an IoT based centralized monitoring elements should further be enabled to communicate the status of their individual locations to an IoT based central and monitoring elements should further be enabled to communicate the status of their individual locations to an IoT based centralized monitoring and control center bracket CMS that enables the water. The control and monitoring elements should further be enabled to communicate the status of their individual locations to an IoT based centralized monitoring and control center bracket centralized monitoring and control Centre (CMS) that enables the water supply system to be monitored from one single location for the entire city / town.

CHAPTER -7-COST ESTIMATE

The cost estimate was prepared by taking the rates from the reference documents,

- CMWSSB Schedule of rates 2024-25
- Govt. of Tamil Nadu
- MJP (Maharastra Jeevan Pradhikaran) SoR 2023-24
- RUIDP (Rajasthan Urban Infrastructure Development Project) SoR 2023
- SoR Odisha 2024
- Circular dated 10-09-2020, GCC- Greater Chennai Corporation- Bus route road Department

The items are not available in the SoR, market price has been adopted by taking of quotation from relevant Suppliers/Manufactures.

The Trenchless work item rate is taken from MJP SoR as the details are available in the respective SoR and vendors are not responded in detailed of the item to be executed.

The instrument like pressure gauge, Motor Operated Valve & pressure transmitter rates are taken from RUIDP SoR as quoted prices are enormously vary among the vendors.

The items MS pipe and VT pump prices are taken from SoR Odisha as the price per HP for pumps and MS pipe with fittings per meter length are not provided by the vendors.

The cost estimate is optimized with incorporating the observations provided by CMWSSB officials. The cost estimate is attached in **ANNEXURE 2**.

As per CMWSSB officials, the road restoration work will be done by GCC team by depositing the fund to GCC department as per the Circular dated 10-09-2020, GCC- Greater Chennai Corporation- Bus route road Department. The road restoration cost has been worked out which is 104.61 Cr. The cost is derived considering the bus route, non-bus route, types road etc.,

The derived cost estimate is based on the following:

- 1. Capital investment costs for supply, installation, construction, testing & commissioning as CAPEX (Capital Expenditures).
- 2. Operational and maintenance costs are required to maintain and keep the systems working efficiently, OPEX (Operational Expenditures).
- 3. Financial models for funding by Public-Private Partnership (PPP).

7.1. CAPITAL COST:

The items of bill of quantities considered in the estimates are as follows,

- Distribution Pipe network -Pipes / fittings materials supply / installation / testing / commissioning /spare parts
- Integration with existing water supply Network

- Provision for Cleaning & Flushing of existing pipes
- Road restoration
- Trenchless Arrangement
- Electro-mechanical Instruments
- Transformer & DG set
- Site Clearence & Development
- House service connections
- Gas Chlorine Dosing System
- Automatic Metering Infrastructure
- Measuring & Control Instruments
- Server & Data base
- Communication Infrastructure
- Control & Monitoring panels
- Software
- Operation & Maintenance for 15 years, for the operational area under WDS.

In addition to the item rates, the costs are also considered for the following sub rates as per CMWSSB practice

- Contingencies & unforeseen items
- Provision for investigation charges
- Independent Engineer Charges
- Labour welfare cess
- Third party inspection charges
- TNEB service connection charges
- Provision for shifting of underground utilities
- Price Index Impact
- Interest during Construction
- GST

7.2. Operational & Maintenance

The operational and maintenance cost has been derived by applying as per the industries practices & CPHEEO manual- 2023. The concession period considered is 17 years, overall, which includes 2 years of construction & 15 years of operation period.

CHAPTER -8-FINANCIAL MODEL

8.1. PROJECT BACKGROUND:

Chennai Metro Water Supply and Sewerage Board (CMWSSB) has proposed implementing a 24-x7 water supply system in the areas covered by the water distribution systems (WDS) at Pallipattu and Thiruvanmiyur in Chennai. The project involves investment in improvements to the existing distribution system, installation of electronic meters for recording water consumption by different categories of consumers and subsequent operations and maintenance (O&M) of the WDS to provide reliable water supply. The project will be implemented using a Concession framework on Public Private Partnership basis through a Hybrid Annuity Model (HA-M). Under HAM, the selected PPP developer (the Concessionaire) will be responsible for implementation and operations for an agreed period, i.e. the Concession Period which includes the construction period and the operations period.

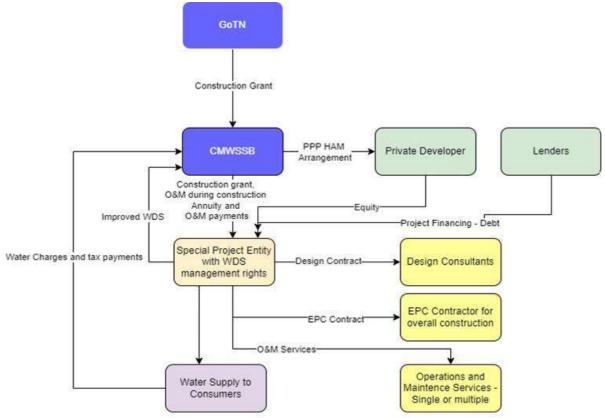

Fig 8.1Project Structure

8.2. PROJECT SCOPE AND COST:

The WDS for Pallipattu and Thiruvanmiyur locations to be improved under the project is expected to initially cover 63,933 consumers including residential and non-

residential consumers distributed as follows.

Tuble of Not of consumers						
Water Distribution System	No of Consumers	Percentage				
Pallipattu - Residential	42,999	67%				
Pallipattu - Institutional / Other	6,371	10%				
Thiruvanmiyur - Residential	13,308	21%				
Thiruvanmiyur - Institutional /	1,255	2%				
Other						
Total	63,933	100%				

Table 8.1 No. of consumers

Source: CMWSSB

It may be noted that the number of consumers is expected to increase during the concession period at the rate of 0.68% per annum, mirroring the growth in the state population.

Financial feasibility analysis is necessary to adopt a bankable project structure that dovetails the financial interests of the Concessionaire and CMWSSB. This analysis includes presentation on the financials of the PPP developer and CMWSSB based on project expenditure and remuneration during the concession period under the HAM framework.

8.3. THE HYBRID ANNUITY MODEL

Under HAM, the PPP developer is required to undertake implementation of the project during the construction period and operate and maintain the project to provide required services to users based on agreed standards of performance. For this, the developer is remunerated with payments during the construction and operations period as follows.

8.3.1. Payments during Construction Period:

- a. Construction period grant Currently considered at 60% of the cost of project implementation as milestone linked payments with each payment adjusted for inflation in project cost during the construction period. Payable upon achievement of physical progress over pre-defined milestones
- b. O&M payments for operations and maintenance of the existing water distribution system payable on a monthly basis.

8.3.2. Payments during Operations Period:

a. Balance of cost of project implementation – Currently assumed as 40% (100% -Construction period grant) of the Total Project Cost (Adjusted for inflation during the Construction Period) – Payable every quarter of the operations period together with interest on the unpaid balance of Total Project cost. The interest rate on unpaid annuities is currently assumed as 10.95% per annum which

represents a 2% spread over the Marginal Cost based Lending Rate (MCLR) of SBI which is presently 8.95%.

b. O&M payments for Operations and Maintenance of the upgraded water supply system as per agreed Key Performance Indicators (KPIs) are payable every quarter. There is an annual increase in this amount linked to inflation.

8.3.3. Bid parameter under HAM:

The bid under HAM comprises 3 elements, (i) the bid project cost (ii) the O&M during construction and (iii) the O&M during the operations period. All the amounts receivable by the developer over the Concession period shall be projected and the net present value (NPV) of these amounts shall be computed to arrive at the levelized NPV. The bidder with the lowest levelized NPV shall be the selected bidder.

8.3.4. The Concession Period:

The Concession period considered for the analysis is 17 years overall which includes 2 years of construction and 15 years of operations

8.3.5. Summary of financial analysis for PPP developer:

The project cost shall be financed by the developer as follows. The capital structure after excluding the construction grant of 60% works out to a debt-to-equity ratio of 2:1. However, when the construction grant is also considered, the capital structure comprises 13.37 percent equity, 26.74 percent debt and the balance 59.90 percent grant.

Capital Structure	Overall	After excl. grant	INR Crore
Equity	13.37%	33.33%	36.99
Debt	26.74%	66.67%	73.99
Grant-	59.90%		165.75
Construction			
Total	100%		276.73

Table 8.3 Capital structure

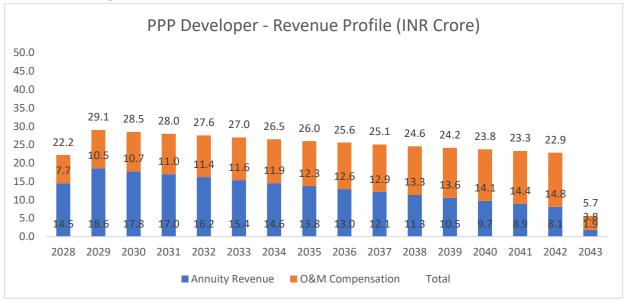

Source: Consultant Analysis

The debt facility is assumed to have a door-to-door tenor of 10 years, a moratorium period of 2 quarters post commercial operations date and an interest rate of 9.5 percent. Though the interest rates are typically variable, it has been considered as a constant for the purpose of analysis as the rates might either increase or decrease based on market conditions.

8.3.6. Revenue Profile:

The revenue profile of the developer is as follows. The revenue figures are around INR 20 to 30 crores per year. It is higher in earlier years and reduces over the concession period. This is due to the capex component of annuity being constant every year. Consequently, the interest component of annuity decreases while the O&M payment

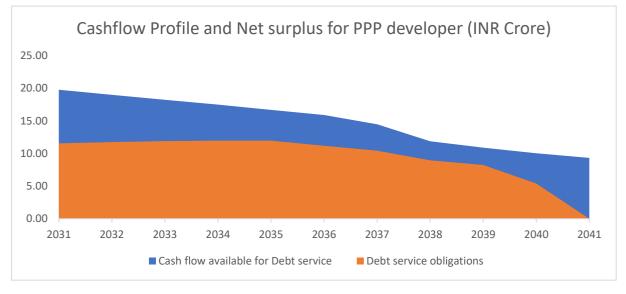

linked to inflation increases every year. Hence, the overall revenue to the developer is within the range i.e. INR $20 \sim 30$ crore.

Source: Consultant Analysis Figure 8.2 PPP Developer Revenue profile (INR Crore)

Consequently, the cashflow profile when compared with debt service obligations indicates a comfortable debt servicing profile. From the figure below, it is seen that the cash flow available for debt service after accommodating O&M obligations is higher than the debt servicing requirements.

Source: Consultant Analysis

Figure 8.3 Cashflow and net surplus profile for PPP developer (INR Crore)

8.3.7. Project financial returns:

The analysis indicates that the project financial returns for the PPP developer are comfortable with a project IRR of 10.29%, equity IRR of 12.28% and a minimum Debt Service Coverage Ratio (DSCR) above 1.32.

8.3.8. Analysis of CMWSSB financials:

CMWSSB cash flow profile is linked to income from consumers who are charged (i) water consumption charges and (ii) water tax. For residential consumers, the consumption charges are based on the tariff profile below.

Tariff - Residential C	Rate/KL/month in INR	
From 0	to 10 KL	6
11	to 15 KL	18
16	to 25 KL	28
26	45	
Minimum Charges (I	100	

Table 8.4 Water Tariff

Source: CMWSSB

For non-residential consumers, the tariff is charged at a flat rate of INR 90 per KL. The tariff is assumed to increase at the rate of 10% once every two years. The estimated average water consumption is 1 KL per day per residential consumer in Thiruvanmiyur and 0.74 KL per day per residential consumer in Pallipattu.

It may be noted that the construction grant for the project is supported by the Government of Tamil Nadu. Whereas, CMWSSB has to manage payments to developer during the operations period. These payments attract 18% GST which is a cost to CMWSSB as the input tax credit on the same is not available owing to CMWSSB's output services not being subject to GST.

Detailed Project Report

The cumulative cash flows to CMWSSB and the Net Present Value (NPV) of the Cash flows to CMWSSB are as below:

Table 8.6: CMWSSB Cumulative Surplus and NPV of cashflows (INR Cr.)

	Amounts in INR Crore
NPV of Cashflows*	196.79
NPV of O&M period Payments only	341.62
Cumulative Surplus/Deficit	718.15
Cumulative Surplus/Deficit (Excluding	883.89
Construction Grant)	

*Discount rate of 8% (~1% above 10 year G-sec yield of ~7% currently) considered for arriving at the Net present value

A comparison of the expected financial position of CMWSSB in the with and without project scenario is considered essential to justify the project. The above analysis indicates that the net cashflow to CMWSSB is positive even after providing for annuity related payment obligations. Further, it is observed that due to metering and subsequent enforcement of consumption linked payments, CMWSSB is likely to witness revenues increasing by about 150%. It is also noted that the construction grant payable to the developer is funded by the Government of Tamil Nadu. Consequently, the net cost implication on CMWSSB is limited to O&M costs under with and without project scenarios. Basis this, a comparison of cash flows for CMWSSB with and without the project was undertaken. The results are as follows:

	With Project	Without project
Cumulative Cash surplus for CMWSSB	718.15	281.98
NPV of cash flows*	196.79	122.76

Table 8.7: Comparison with and without the project (INR Cr.)

*Discount rate of 8% (\sim 1% above 10 year G-sec yield of \sim 7% currently) considered for arriving at the Net present value.

From the above, it is observed that the project investment and the consequent change in billing approach have a net positive impact on CMWSSB financials. The detailed Financial Model is given at **Annexure 1**.

CHAPTER -09-OPERATION & MAINTENANCE

The overall objective of the "Drink from Tap" 24x7 water supply system is to deliver wholesome water to every consumer 24 hours a day, every day of the year at adequate residual pressure in sufficient quantity at the farthest /convenient points and achieve continuity and maximum coverage at affordable cost. The "Drink from Tap" 24x7 water supply system consists of a well-designed water distribution system that is continuously full and under positive pressure throughout all its pipelines and networks. To attain this objective the water supply organization has to evolve operating procedures to ensure that the overall system can be operated satisfactorily, function efficiently, effectively and continuously. The water distribution network is the front face to the consumers and people. The water is supplied through well-articulated network of pipelines with various appurtenances including valves collectively called as the water distribution system (WDS), which involves operation of network spread over a large area. Since, the WDS O&M task is human resource intensive and too many variables are involved in its successful operation, the well-trained O&M staff are the key to the overall success of the WDS operations and the water supply system as a whole, which are created with, generally, huge investments.

9.1. NORMAL OPERATIONS

The 24x7 operations are intended to maintain the required supply and pressure throughout the distribution system. Critical points are selected in a given distribution system for monitoring pressures, flow and quality by installation of pressure recorders, meters, gauges and sampling monitoring systems. These parameters are either measured manually and data records transmitted to the control station or automatically measured and transmitted by telemetry or by Supervisory Control and Data Acquisition (SCADA) systems to control station. Digital Twin Technology is used for analyzing data and taking decisions.

The distribution system is usually designed as a continuous system but mostly operated as an intermittent system. Intermittent supply creates doubts in the minds of the consumers about the reliability of water supply quantity and quality. This leads to limited use of the water supplied, which does not promote personal hygiene at times. During the supply period the water is stored in all sorts of vessels for use in non-supply hours, which might contaminate the water. Often, when the supply is resumed, the stored water is wasted and fresh water again stored. During nonsupply hours polluted water may enter the supply mains through leaking joints and pollute the supplies. Further, this practice prompts the consumers to always keep open the taps of both public stand posts and house connections leading to wastage of water whenever the supply is resumed. Intermittent systems and systems which require frequent valve operations are likely to affect equitable distribution of water mostly due to operator negligence.

9.2. Monitoring of Flows, Pressures and Levels

It will be necessary to monitor regularly operational data concerning flows, pressures and levels to assess whether the system is functioning as per requirements. Analysis of data may reveal over drawl of water to some reservoirs and or bulk consumers. At such places appropriate flow control devices may be introduced to limit the supplies to the required quantity. A list of priority points in water supply system have to be identified such as installation of meters to measure flows, pressures and levels. A detailed map showing location for each measuring point has also to be prepared. The degree of sophistication of the devices used at each measuring point with regard to indication, integration, recording, transmission and reception of data depends mainly on the skills of O&M personnel.

9.3. Water Quality Management

Water quality management is of prime importance to test the performance of operation and maintenance of the distribution system in order to provide 'Drink from tap' and its ability to deliver water of acceptable/permissible quality to its consumers conforming to IS 10500 (2012). The most important potential consequences of improper and ill managed distribution system is health problems caused by presence of substances more than acceptable limit in the water. In order to ensure potable water supply for drinking purpose, it is essential to monitor water quality at various locations in distribution system as well as at consumer ends at regular interval/frequency for various physical, chemical and bacteriological parameters for which services of in-house or NABL accredited outsourced laboratories can be availed.

S. No.	Parameters	Test Frequency
1	рН	Fortnightly
2	Turbidity	Fortnightly
3	Electric Conductivity	Fortnightly
4	Residual chlorine	Fortnightly
5	E.coli (faecal coliform)	Fortnightly

 Table 10.1: Water quality Parameters & Test Frequency

Table: shows Minimum routine monitoring frequency of water quality parameters in water distribution system.

Table: Minimum routine monitoring frequency of water quality parameters in water distribution system (Introduction to O&M of water distribution system: JE Val Zyl - Water Research Commission)

The water supply authority needs to ensure proper water quality management in distribution system.

9.3.1. System Surveillance

Surveillance of distribution system is done to detect and correct. Routine surveillance shall reveal:

- Sanitary hazards.
- Deterioration of distribution system facilities, (to detect).
- Encroachment of distribution system facilities by other utilities such as sewer and storm water lines, power cables, telecom cables etc. and
- Damages of the system facilities by vandalism. (Detecting and correcting).

In addition, checks are carried out under special circumstances for assessing damage of the system after flooding of streets following a heavy storm. All these checks are done for above ground water facilities such as valves and valve chambers or exposed pipelines. Some less frequent inspection of underground pipelines will also be required, wherein critical areas of the distribution system should be patrolled routinely so that the water utility can watch out for early warning of any adverse conditions of the distribution system. Any activity or situation that might endanger the water facility or water quality shall be investigated and corrective action is to be taken. Surveillance shall also include looking for unauthorized construction activity on or near the utility's pipelines, which may pose a physical threat to the mains. Any digging or excavation or blasting near the mains shall be closely supervised by the utility staff.

9.3.2. Staffing

The work and monitoring of the distribution system shall be conducted on a 24 hour per day, continuous basis, without interruption. The necessary supervision during the 0&M period. Such supervision shall be given by a competent person having adequate knowledge of the operation and maintenance duties to be carried out including the methods and techniques required, the issues likely to be encountered and methods of preventing breakdown as may be required for the satisfactory working within the WDS. The number and details of personnel (minimum) to be employed by the employer shall be given as stated below. In addition, this adequate number of staff and unskilled personnel during the 0&M period, may be deployed as and when required.

Designation	No of Staff	Category
Electrician Grade-I	2	High skilled
Mechanic- I class	2	Skilled
Pump Driver	6	Semi-Skilled
Plumber	2	Semi-Skilled
Fitter-I Class	4	Skilled
Helper	18	Semi-Skilled

Table 10.2: Staffing

Designation	No of Staff	Category
(mazdoor category I)		
SCADA Operator	1	High skilled
SCADA Operator Assistant Grade-II	3	High skilled
Watchman (For WDS) Time Keeper-II Class	6	Semi-Skilled
Staff for Water Quality Sampling Laboratory Assistant Grade-III (With Degree Qualification to work as works clerk)	3	High skilled
billing collector	4	Semi-Skilled
TOTAL MANPOWER	29.00	

9.3.3. Maintenance Schedule

Maintenance schedules can be designed considering points summarized below:

i.General

A maintenance schedule is required to be prepared to improve the level of maintenance of water distribution networks and house connections through improved co-ordination and planning of administrative and field work and through the use of adequate techniques, equipment and materials for field maintenance.

- The schedule has to be flexible so that it can achieve team action with the available vehicles and tools.
- Co-ordination of activities is required for spares and fittings, quality control of materials used and services rendered.
- Training of maintenance staff shall include training to achieve better public relations with consumers apart from the technical skills.

ii. Activities in Maintenance Schedule

The following activities are to be included in the schedule:

- Establishment of procedures for setting up maintenance schedules and obtaining and processing the information provided by the public and the maintenance teams.
- Formation of maintenance teams for each type of service with provision for continuous training.
- Establishment of repair procedures for standard services.

- Specification of appropriate tools.
- Allocation of suitable transport, tools and equipment to each team.
- Establishment of time, labour and material requirement and output expected; time required and other standards for each maintenance task, and monitoring the productivity of each team.

iii. Preventive Maintenance Schedule

A preventive maintenance schedule for Servicing of Valves and Maintenance of Valve Chambers, Maintenance of the pipelines: may include the tasks, set priorities, issue of work orders for tasks to be performed, list of scheduled tasks not completed, record of when the tasks are completed and maintaining a record of tools, materials, labour and costs required to complete each task.

a) Servicing Valves

Seating of valves which are subject to operations several times is likely to become leaky or pass the flow downstream even after closing tight. Periodical servicing will be required for valves on hydrants and public taps, flow meters and pressure gauges. Corrosion of valves is a main problem in some areas and can cause failure of bonnet and gland bolts. Leaks from spindle rods occur and bonnet separates from the body. Stainless steel bolts can be used for replacement and the valve can be wrapped in polyethylene wrap to prevent corrosion.

b) List of Spares

A list of spares required for the distribution system maintenance shall be prepared and shall be procured and kept for use. The list should indicate the minimum level at which action for replenishments should be initiated. The list of probable spares to be kept in stock may include the following: Spare check nuts and spindle rods and assorted bolts, nuts and washers for the flanged joints, gaskets for flanged joints for all sizes of sluice valves installed in the distribution system, spare manhole covers and consumables like the gland rope, grease, cotton waste, spun yarn, pig lead and lead wool, O rings, mechanical joints and fittings, etc.

c) List of Tools

The necessary tools to properly repair and correct both the routine problems and for facilitating repairs and replacements in a distribution system have to be identified and provided to the maintenance staff. Some of the tools for the maintenance work in a distribution system are: Key rods for operation of all sluice valves, hooks for lifting manhole covers, pipe wrench of appropriate sizes (200, 300 or 450 mm), Double ended (DE) spanner set, Ring spanner set, Screw Drivers, Pliers, Hammers, Chisels, caulking tools for lead and spun yarn, ladles and pans for melting and pouring lead joints, excavation tools such as crow bars, spades, iron baskets, buckets and de-watering pumps.

d) Maintenance of Valve Chambers for Appurtenances

Valve chambers are generally filled with leakage in the glands, shafts, etc. and the stagnant water if not drained properly can be sucked into the distribution system. Hence, these chambers required robust drainage arrangement and regular maintenance to keep that clean and hygienic. Valve chambers shall be checked to ensure that they are not damaged, nor filled up with earth nor buried in pavement. Covers of valve chambers are stolen or broken up by vandalism or by accident resulting in damage to the valves or may lead to accidental fall of a person into the open valve chamber. Such situations have to be corrected as a priority. Road improvement works require constant attention of water utility staff since the valves may be lost or at times the valve chambers in the roads have to be reconstructed to match the renewed road surface. Precaution shall be taken to provide the valves where absolutely essential because maintenance of valve chambers is an herculean task in the distribution system. These valve chambers are becoming dustbins and point of contamination of the water. Alternatively, valve chambers can be constructed based on the essentiality (access required for regular operation) otherwise, can be buried after inserting a pipe or similar type of any special above the spindle so that 0&M team can access wherever there is requirement.

e) Operation under emergency Conditions

Operations other than routine viz. during breakdowns and emergencies have to be specified and should be carried out in specific circumstances when normal conditions change i.e., when flows, pressures and levels and operation of pumps change. A standard operating procedure for valves should be prepared and emergency conditions should be considered into it. The objective of developing a program for managing in times of shortage of water is to reduce the excessive use of water particularly when the source is limited due to adverse seasonal conditions. The water managers play an important role in managing the water supplies during emergencies. Their role can be fulfilled by:

- (i) Giving an emergency condition notification so that people could get aware;
- (ii) Define new policies to balance the demand and supply of water so that at least basic needs of every person can be fulfilled.
- (iii) Water quality should be monitored properly by the water managers so that water should be safe
- (iv) Water managers must see that emergency response plan includes a wellprepared communication strategy.
- (v) A proper Vulnerability Assessment of every affected area should be done.
- (vi) Special Monitoring, Vigilance and Response action team should be made to reduce the wastage and equitable distribution of water and verify that the policies made are properly followed.

(vii) Alternative water sources available near the affected area must be looked into.

f) Monitoring System Performance

Normally the managers of O&M of water utilities monitor levels in service reservoirs, pressures and flows in the distribution system and operation of pumps such as hours of pumping, failure of pumps and monitor water quality by measuring residual chlorine. The manager usually uses telephone line or wireless unit to gather the data, maintain records analyses, uses his discretion gained with experience and takes decisions to ensure that the system is operating with required efficiency. Manual collection of data and analysis may not be helpful in large undertakings if water utilities have to aim at enhanced customer service by improving water quality and service level with reduced costs. In such cases monitoring system performance can be done with use of Telemetry and SCADA and Digital Twins.

(i) Quality of Pipe Material for House Connection

The water utility shall ensure that the connection and communication pipe from the street main up to the consumer premises is laid as per correct plumbing practices and adopt improved methods for tapping the main. Strict quality control is required on the pipe material used for house connection. The bye Laws shall lay down rules for defining the ownership and responsibility for maintaining the point of connection and the communication pipe. In several utilities the communication pipes are leaking since they are corroded; however, these are not replaced by the consumer or by the utility particularly where the O&M responsibility for consumer pipe rests with the consumers.

(ii) Contamination Through House Connection

While laying the consumer connection pipes, there is a need to avoid contamination of water supplies. This can be achieved by maintaining horizontal and vertical separation between the water supply communication pipe and the sewer/drain. In some instances, a sleeve pipe may be required to be provided to the consumer pipes crossing a drain. It is always recommended to provide a non-corrodible pipe material for the consumer connection. Contamination by possible back flow can also be prevented by ensuring provision of double check/non-return valves at the consumer end.

(iii) Rules for Consumer Connections

The water utility shall formulate rules for sanction of consumer connection. Tapping the branch line and laying the connection piping. At no circumstances, a consumer connection is permitted from the mains. On unavoidable circumstances, a separate parallel pipeline/ rider pipeline has to be drawn from

the nearby existing distribution system. Water utility shall undertake inspection of the consumer premises before releasing the connection to ensure that the internal plumbing system of the consumer conforms to the National Building Code. Water utility shall supervise the process of drilling/tapping of the main for giving connection and laying of the consumer piping. The process of submission of applications for connections by consumers and carrying out the connection work through licensed plumbers is also prevalent in some utilities. In such cases the utility shall formulate procedures for licensing the plumbers including the qualifications to be possessed by the plumber, facilities and tools to be available with the plumber for the work to be undertaken by the plumber. The utility shall closely observe the quality of materials used and works done by him and he should act as per procedures laid down in the bye laws for approval of the connection works, renewal or cancellation of the plumbers' licenses or any other requirement depending on their performance or non-performance. For all the service connections, Ferrule should be provided/fixed with saddles and compression fittings to avoid leakages from the connection joint.

g) Records and Reports(i) Record System

A record system has to be developed which should be realistic and apply to the operating problems involved in the distribution system. Management must be clear as to why the data/information is collected, as to who will review the data and who will respond to the results of review. The most efficient way to keep records is to plan what data is essential and then prepare the formats followed by the persons concerned for filling of the data, frequency and to whom the record is to be sent for review and report. The agency should make a repository of real time data at the discretion of the authority in managing and taking an appropriate decision of the system. Sample records to be maintained are given below for guidance:

- Updated system map.
- Pressure and flow readings at selected monitoring points.
- Persistent low pressure or negative pressure areas.
- Age of pipes/quality of pipes.
- Pipelines to be replaced.
- Presence of corrosive water in the system.
- Water budget for each zone served by one SR.
- Number of connections given.
- Number of meters out of order.
- Status of fire hydrants and public taps.
- Quantity measured at outlet of reservoir.
- Quantity distributed/measured or billed.
- Source of leaks and persistent leak points.
- Status of bulk meters function or not.

- Status of consumer meters.
- Facilities for repairs of consumer meters.
- Number of unauthorized connections.
- Residual chlorine levels at the pre-selected monitoring points.
- Bacteriological quality of the water sampling points.
- Persistent areas where residual chlorine is absent/ where bacteriological
 - samples are unwholesome.
- Record on carrying out repairs on the following works and its cost:
- The pipe line leaks or replacement of pipes.
- Change of gland ropes of the valves in distribution system.
- Replacement of parts.
- Replacement of manhole covers.
- Record on man hours spent on routine operations in the distribution system in the previous year and the cost thereof.
- Record on total cost of repairs and replacements in previous year along with break-up of material cost and labour cost with amount spent on outside agencies for repairs and replacements.
- Record on when the exposed piping was last painted and the cost of materials and labour cost thereof.
- Record on the unserved areas extension of pipelines- need for interconnections.

(ii) Reports

With the accumulation of all essential data a report can be prepared evaluating the O&M of the facility. The report can identify the deficiencies in the system and its appurtenances and then plan future repairs to the network or valves and other equipment or for replacement of defective valves or other equipment or additions and extensions to the distribution network.

(iii) Computerized Maintenance Management System (CMMS)

Computerized Maintenance Management System (CMMS), also known as Computerized Maintenance Management Information System (CMMIS), is a software package that maintains a computer database of information about an organization's maintenance operations. This information helps in maintenance of the system by determining which component (pipes, machinery, instruments, chemicals, manpower, etc.) requires maintenance and where the spare parts are. The CMMS System also keeps track of all the maintenance work involved by generating work orders, procurement orders, vendor orders, stores inventory, as well as the cost involved in all the activities thus help to accurately calculate the budget needed for O&M. CMMS also allows to keep record and geotagging of the components in the system which can be linked to GIS and network model, which in turn helps to analyze and keep track of various maintenance works.

CHAPTER -10-SOCIAL & ENVIRONMENTAL IMPACT ASSESSMENT

10.1. INTRODUCTION

Chennai formerly known as Madras, is the capital city of Tamil Nadu, the southernmost Indian State. It is the state's primate city both in area and population and is located on the Coromandel Coast of the Bay of Bengal. According to the 2011 Indian census, Chennai is the sixth most populous City in India. The population of Chennai Core city as per the 2011 census was 46,46,732, and the area is 176 Sq km. The city has 7 administrative areas, namely IV, V, VI, VIII, IX, X & XIII, covering 107 Wards/Depots.

Chennai Metropolitan Water Supply and Sewerage Board (CMWSSB) is responsible for the administration and operation, and maintenance of Chennai City's water production, treatment, storage, distribution, billing and revenue collection.

The present water supply system is intermittent due to various constraints in source, storage facilities and adequacy of the existing distribution system. The Chennai Core city's average per capita water supply is around 100 Liters Per Capita per Day (Lpcd).

It is observed that, despite of the fact that, water supply of 936 MLD is supplied for 8.38 lakh consumers of 7.4 million Population, 126 Lpcd water should reach every household. However, as reflected in the Area-XIII DPR, the average supply is around 100 Lpcd and there is a huge inequity in supply and some streets are not getting any water despite of water pipes laid in the street. The high rate of NRW is also apprehended.

Further, to improve the current water supply situation, the Chennai Metropolitan Water Supply and Sewerage Board is implementing a 400 MLD Sea Water Desalination plant at Perur, additional storage facilities and other allied works with JICA assistance.

Chennai Metropolitan Water Supply and Sewerage Board ("CMWSSB") has prepared a DPR from SMEC, Tata Consulting Engineers Limited, and NJS Consulting Engineers for Administrative Block X and XIII and submitted to funding agency (World Bank). World Bank has observed that it is suggested to replace 75% of existing pipelines to achieve target of 24X 7 water supply, which seems to be high and suggested to Chennai Metropolitan Water Supply and Sewerage Board ("CMWSSB") to take technical assistance from WATCO (Water Corporation of Odisha, Government of Odisha) who are executing 24X7 water supply in existing townships of Odisha. Chennai Metropolitan Water Supply and Sewerage Board ("CMWSSB") approached WATCO and after meeting with top management of both organizations, Project Management Consultancy Services has been awarded to WATCO for planning designing and implementation of 24X7 water supply to Administrative Block 10 and 13 of Chennai Metropolitan Water Supply and Sewerage Board.

10.1.1. Sources and Pattern of Water Supply

The overall water supply scenario of entire Chennai city is exhibited below.

Table 11.1: Water Supply Scenario of Chennai City

Operational Area	426 sq.km
Topography	Generally Flat
Current Population	7.4 millions
Current water supply	1015 mld
Water Treatment Capacity	1,494 mld
No. of Consumers	8.38 lakhs

10.1.2. Water supply sources for Chennai City

Table 11.2: Water supply sources for Chennai City

Source	Quantity of water drawn in MLD
City Reservoirs	690.00
Veeranam Pipeline (Bore wells, NLC mines & Paravanar)	163.00
Desalination Plants (Minjur & Nemmeli)	138.00
Well Fields	4.00
Added areas ground water	20.00
Total	1015.00

10.1.3. The water supply pattern of supplying 1015 MLD of water

Table 11.3: Water supply Pattern

Water Supply Pattern	Distribution in MLD
Piped Supply	936.00
Industrial and Bulk Supply	51.00
Water tanker Lorry Supply (3,543 trips through 408 lorries)	28.00
Total	1015.00

10.2. Structure of ESIA Report

The ESIA report for the project has been prepared complying country Acts, Policies and The World Bank Guidelines for Environmental and Social Assessment. The report has been structured in the following Chapters:

- 1. Introduction
- 2. Project Description
- 3. Legal and Regulatory Aspects
- 4. Environment and Social Baseline
- 5. Potential Environmental and Social Impacts and Mitigation
- 6. Environment and Social Management Plan
- 7. Stakeholder Engagement
- 8. Grievance Redressal Mechanism
- 9. Institutional Arrangement
- 10. ESMP Implementation Budget

10.2.1. Project Description

Urban water sector is facing the challenges of poor quality of water. Intermittent water supply often results in contaminated drinking water. During non-supply hours, there is a vacuum inside pipelines due to which outside dirt/contaminants find entry into the pipelines, thus, water gets contaminated. When supply of water starts, the contaminants are mixed with the treated water, further contamination takes place. In 24×7 water supply system, pipelines are pressurised and hence outside dirt cannot find entry inside, hence water retains its quality. People are not having trust on quality of municipal water because of contamination in supply, and they tend to purchase small reverse osmosis (RO) machines in their homes. Household treatment facility at their home and its maintenance, cost of electric power for its operation increases cost of living. As water supply is intermittent, people must keep water stored for daily needs put additional burden, and due to less pressure in distribution pipeline, lifting arrangement is required which increase further financial load on consumer. As RO is used by user to get good quality of water, 2/3rd of water received from is wasted as process waste of RO resulting in increase in water demand.

As Chennai Core City is having sufficiency in source of water, but due to inadequate distribution system, people are not getting enough water. The present water supply system is intermittent due to various constraints in source, storage facilities and adequacy of the existing distribution system. The Chennai Core city's average per capita water supply is around 100 Liters Per Capita per Day (lpcd).

CMWSSB has decided to provide 24X7 water supply to pilot area, administrative areas X and XIII on priority. Based on the client's requirement, DPR by a consortium

of consultants (SEMC, TCE, NJS, SMCE India) has been prepared and submitted to funding agency for approval execution purpose. The DPR was reviewed, and it was pointed out by funding agency that replacement of existing system proposed (75% replacement) in DPR seems on higher side. As WATCO has been working in 24X7 water supply in Odisha, CMWSSB has approached WATCO for technical assistance for assessing the necessity of replacement of existing distribution system.

10.2.2. Project Area

The project area is confined to administrative block 10 (X) and 13 (XIII) of Chennai Metropolitan Water Supply and Sewerage Board.

The area X (Kodambakkam) is shown in yellow, and Area XIII (Adyar) is shown in green are highlighted in the overall water supply zoning map of Chennai City as below.

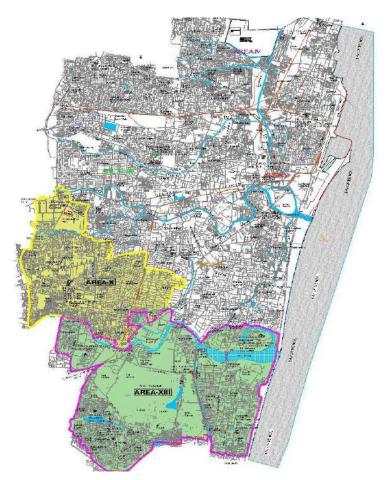

Fig 11.1: Map showing Area X & XIII

10.2.3. Project Objectives

The objectives of the project are:

- i. Provide drink from tap quality drinking water (IS 10500 standard) to every home on round the clock (24X7) basis in area X and Area XIII of Chennai City.
- ii. 100% house connections with metering.
- iii. Equitable, sustainable and people-centric service provision with focus on the urban poor and middle-income people.
- iv. Reduce citizens and household investments on individual household level water tank/reservoir, sump, motor pump, water filter and other private arrangements.
- v. Implementation of Internet of Things (loT) driven smart water management for real time operation & management of the system.

10.2.4. Scope of Services of Consultant

The major scope for Administrative Block X & XIII, under Chennai Metropolitan Water Supply and Sewerage Board are:

- i. Survey and investigations.
- ii. Planning and design for converting the existing intermittent water supply to 24 X7 in all water distribution system of Areas -X and XIII of CMWSSB.
- iii. Preparation of Detailed Project Report (DPR).
- iv. Preparation of technical specifications and tender documents for the works.
- v. Assisting the employer in bidding process and recommendation of the right bidder for award of the works contract for 24 X 7 sustainable water supply.
- vi. To conduct Environment and Social Impact Assessment (ESIA) and prepare the Environment and Social Management Plan (ESMP).
- vii. Services covering approval of detailed designs, coordination with the contractor, works monitoring, assist in dispute resolution, specialized techno-commercial advice during execution of work for ensuring completion of the work in a time bound manner.
- viii. Assist the employer in commissioning of the works.

10.2.5. Project Components:

As per the study plan and design conducted the broad component of the project for administrative bock 10 & 13 are provided below:

S.I	Start Node	Stop Node	Length	Material	Additional required Diameter (in mm)	
1	Nemmeli DSP	Akkarai Pumping Station	22273	DI-K9	1000	
2	Akkarai Pumping Station	Thiruvanmiyur (New) WDS	9642	DI-K9	-	
3.	Akkarai Pumping Station	JI	2720	DI-K9	1100	
4.	JI	Valachery (Old) WDS	11942	DI-K9	1200	
5.	Velachery (Old) WDS	J2	818	DI-K9	1000	
6.	J2	Velachery(New) WDS	920	DI-K9	-	
7.	J2	J3	1215	DI-K9	800	
8.	Velachery (Old) WDS	Pallipatu WDS	5797	DI-K9	500	
9.	J3	J4	3698	DI-K9	-	
10	J4	Pallipatu WDS	800	DI-K9	-	
11	J4	MRC Nagar Nandnam	6240	DI-K9	-	

10.2.6. Design of Transmission Main:

Table 11.4: Transmission Mains

10.2.7. Pump Design Details

Pumps are designed to provide water from WDS to the operational zone, each pump set consists of three pumps out of which one remains as stand by.

Table 11.5: Pumping Details

		1 0
S.I	WDS Name	Required Pump detail (Total HP)
1.	Pallipatu WDS	1460
2.	Thiruvanmiyur (New)	250

10.2.8. Designed Distribution Pipe Details

10.3. LEGAL AND REGULATORY ASPECTS

This section explains the legal & regulatory requirements under different acts / rules and policies for social and environment safeguards. It also identifies the requirement of permits / licenses in the project under different rules /regulation at different stages of the project period. Further, an outline of the environmental and social safeguards policies of the World Bank with applicability to the project has been presented.

The objective of these policies is to prevent and mitigate undue harm to people and their environment in the development process. These policies provide guidelines for Bank and borrower in the identification, preparation, and implementation of programs and projects. They also provide a platform for the participation of stakeholders in project design. In essence, the safeguard policies ensure that environmental and social issues are evaluated in decision making, help reduce and manage the risks associated with the project and provide a mechanism for consultation and disclosure of information.

10.3.1. Act & Policies

The different acts and policies which are most relevant in the context of this project are provided in the below table:

Table 11.7: Relevant Act and Policies					
Act/Policies	Concerned Authority	Responsibility			
Environment	MoEF & CC	Client/Contractor			
Protection Act, 1986					
The Forest	MoEF&CC	Client/Contractor			
(Conservation) Act					
Air (Prevention and	TNPCB	Contractor			
Control of Pollution)					
Act, 1981					
Water Prevention and	TNPCB	Contractor			
Control of Pollution)					
Act, 1974					
Noise Pollution	TNPCB	Contractor			
(Regulation and					
Control Rules) 2000					
and amendments					
Construction and	TNPCB	Contractor			
Demolition Waste					
Management Rules,

1948	Commissioner, Govt. of	
	Tamilnadu	
Workmen	Chief Labour	Contractor
Compensation Act,	Commissioner, Govt. of	
1923	Tamilnadu	

Note: In addition to the above Acts and Rules, the Contractor must comply with the Factories Act, 1948; Employees State Insurance Act, 1948 etc.

10.3.2. Social Policy and Regulation

In this section, the policies and legislations of the Government of India are briefly discussed, that may have bearing on the Project. Later, at the end of the section, the World Bank Safeguard Policies and ESS are presented.

The Right to Fair Compensation and Transparency in Land Acquisition, Resettlement and Rehabilitation (RFCTLAR&R) Act, 2013, enacted by the Government of India is the latest legislation. This is in force and supersedes all other old acts for land acquisition and to determining R&R activities.

10.3.3. World Bank Operational Policy (OP)

Table 11.0. Operational Foncy					
Operational Policy	Objectives and Purpose				
OP- 4.01 Environmental	The objective of this policy is to ensure that				
Assessment	the Bank financed project is				
environmentally sound and sustainable.				e.

OP- 4.04 Natural Habitat	The policy prioritises conservation of		
	Natural Habitats for long term project		
	sustainability.		
OP- 4.11 Cultural property	The policy emphasises preservation of		
	cultural property in the project area,		
	restoration of archaeological monuments		
	and unique environmental features.		
OP– 4.12 Involuntary	The policy objective is to avoid involuntary		
displacement and	displacement and resettlement as far as		
resettlement	practicable by exploring viable		
	alternatives. It also emphasises approach		
	to improve the living standards of the		
	displaced people, encourages community		
	participation in implementation of		
	resettlement activities and help the		
	affected people regardless of their legal		
	status on title of the land.		
OP- 4.36 Forestry	The policy gives importance to restoration		
	of forest eco-system, which entails		
	management and conservation methods of		
	forest flora fauna and wildlife.		

10.3.4. WB-Environment Social Standard (ESS)

Disclosure		

10.4. ENVIRONMENT AND SOCIAL BASELINE

Details of the baseline environmental parameters are required for decision making for the project design, implementation and operation from the environmental point of views. The data has been collected from the primary surveys and secondary sources. It is essential to establish the base line environmental status of the physical, natural and socio-cultural environmental parameters along the project and within the project influence area of 5 Kms.

The ESIA shall cover, the environmental and social impacts due to the project, concerning construction-related environmental and social impacts. The findings of ESIA will guide the effective development of the specific ESMP and facilitate the implementation of safeguard measures appropriately.

10.4.1. Scope of the ESIA/ESMP Study

The scopes of the EIA/EMP study are: -

- Baseline status of environmental and social parameters.
- Identification of the potential impacts during pre-construction, construction and operation phases.
- Developing mitigative measures to sustain and maintain the environmental scenario.
- Providing compensatory developments wherever necessary.
- Preparation of Environmental and Social Management Plan.
- Household surveys and focus group discussion.
- Review of policies and legal framework.

10.4.2. Standard methodology for ESIA study

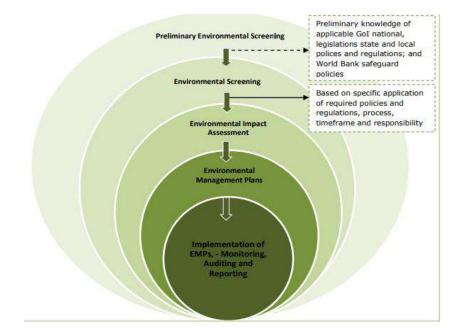

Fig 11.2- Standard Methodology

The area of direct influence is confined in a linear fashion along the corridor, where the construction activities take place. The area of direct influence of 1 Km on either side of PRoW has been considered. Secondary data have been collected within 05 km aerial distances.

10.4.3. ENVIRONMENT AND SOCIAL BASELINE

Meteorology

Chennai has a tropical wet and dry climate. The city lies on the thermal equator and is also on the coast, which prevents extreme variation in seasonal temperature. Meteorological data like monthly total rainfall, maximum & minimum temperature, wind rose and relative humidity of the Chennai for a period of Jan 2011 to Dec 2023 collected from IMD. The collected IMD data depict that the hottest part of the year is in the month of May with maximum temperature varies 41.0°C to 43.0°C. The coolest part of the year is January, with minimum temperature varies 18.7°C to 20.6°C.

Seismicity

As per seismic zoning map of India Tamil Nadu and Chennai are in Moderate Seismic Zone (Zone III–BIS: 1893 (2001)).The last reported tremor in Chennai was on 12 February 2019 due to earthquake measuring 5.1 Richter (Source: IMD) with epicentre 10 km deep in Bay of Bengal.

Topography

Chennai is located on the South–Eastern coast of India in the North–Eastern part of Tamil Nadu. It is situated on a flat coastal plain that's why it is also known as the Eastern Coastal Plains. The study area lies between Latitude of 13° 10' N to 12° 49' N and Longitude of 80° 10' E to 80° 14' E. Chennai is a low-lying area and the land surface is almost flat. It rises slightly as the distance from the seashore increases but the average elevation of the city is not more than 3 m above mean sea-level, while most of the localities are just at sea-level and drainage in such areas remains a serious problem.

Land Use

Land use along the alignment of area X and area XIII is predominantly mixed residential along with few commercial/industrial patches.

Soil and Geology

The recent sandy soil (Entisols) is immature soils and is predominant in the city and it occurs in small patches. The major soil in this region belongs to Alfisols and Entisols. Inceptisols and Vertisols are found in a very limited area only. These soils are generally poor in soil nutrients. They have medium to high permeability. They have low water holding capacity except in patches of clayey soils.

The geological formations in the region are from the Archaeans to the recent Alluvium (Table 4.5). The geological formations can be grouped into three units, namely (i) the

Archaean crystalline rocks, (ii) consolidated Gondwana with Tertiary sediments and (iii) the recent Alluvium. Most of the geological formations are concealed by the alluvial materials, except for a few exposures of crystalline rocks like charnockites along the railway track in Guindy area. The thickness of Gondwana shales is highly variable in the city.

Air Environment

Air pollution is caused due to both natural and manmade processes. The main source of air pollution is human induced/manmade, which includes industrialization and its by products, burning of timber, heat and light, rapid urbanization, vehicular pollution, plastics, burning of polymers and processing of various materials emitting obnoxious gasses, generation of smoke, dust and fine respirable particles due to construction activity and rapid burning etc. Vehicular emission is major source of air pollution now-a-day. Presently some patches of study area are in the locality of heavy traffic movement particularly at congested places i.e at major market areas and junctions, which may impact the ambient air quality of the area. During construction stage of the project, temporary air pollution arises due to movement of construction vehicles, dust emission due to excavation and demolition etc.

Ambient air quality is the most significant parameter that is required to quantify the impact on the natural and biophysical environment. The air quality parameters considered for the construction phase includes Particulate Matter 10 (PM10), Particulate Matter 2.5 (PM2.5), Nitrogen Oxides (NOx) Sulphur Di-oxide (SO2), and Carbon monoxide (CO).

Parameter	Technique	Technical Protocol	NAAQM Standards (24 hrs basis)
Particulate Matter (Size less than 10μm) or PM10, μg/m3	Respirable Dust Sampler (Gravimetric method)	IS-5182 (Part-IV)	100
Particulate Matter (Size less than 2.5µm) or PM2.5 , µg/m3	PM 2.5 APM 550 Fine Particle Sampler (Gravimetric method)		60
Sulphur Dioxide (SO2), μg/m3	Improved West and Gaeke Method	IS-5182 (Part-II)	80
Nitrogen Dioxide	Jacob and Hochheiser	IS-5182 (Part-IV)	80

Table 11.10: Ambient Air Quality Standard

Parameter	Technique	Technical Protocol	NAAQM Standards (24 hrs basis)
(NO2), μg/m3			
Carbon Monoxide (CO), mg/m3	Non – dispersive Infrared (NDIR) Spectroscopy	IS-5182 (Part-IV)	4

Water Resources

As the city lacks a perennial water source, catering to the water requirements of the population has remained an arduous task. Ground water levels from Jan 2022 to Jan 2023 were up to 10m below ground in pre-monsoon as well as post-monsoon seasons and rise in water level of up to 2m to 4m in all observation wells in Chennai district between pre-monsoon and post-monsoon months. From May 2016 and May 2022, the ground water levels were up to 4m in 77% of observation wells. (Source: Groundwater Yearbook of Tamil Nadu and UT Puducherry, 2022 – 23, Central Groundwater Board).

Drainage

Adyar River originates at the confluence (Thiruneermalai) of two streams that drains the upstream area of Chembarambakkam tank. It is a small river of 42 km length and a catchment of 800 Sq. km. The river carries flow all through 365 days of a year with an average discharge of 89.43 MCM/Year at Kathipara cause way. It drains the southern part of the district and remains flooded during monsoon. During the high tides, the backwater from the Bay of Bengal enters inland up to 3 to 4 km.

Cooum or Koovum (sometimes called Triplicane River) is the other main river flowing through the central part of the district and carries only drainage water, which is highly polluted. It originates from the surplus waters from the Cooum tank in Tiruvallore taluk and the tanks, which are in enroute, discharge their surplus water into the river during flood season. The flow of Cooum River at Korattur is 40.2 MCM/year for an average duration of 31 days in a year.

Otteri nala is another small stream flowing in the northern part of the city. Buckingham canal is the man made one for navigation purposes earlier, but now it acts as sewerage carrier in the city.

Noise

Noise can be defined as any sound that is undesirable because it interferes with speech and hearing and is intense enough to damage hearing or is otherwise annoying. Noise impacts can be of concern during construction phase.

Noise quality is an issue particularly at congested locations due to heavy traffic jams, horns and slow-moving traffic. The educational institutions, health care facilities, Court

etc along the project corridor comprise sensitive receptors with respect to noise pollution.

The Ambient Noise Quality Standards with respect to noise have been stipulated by Govt. of India vide Gazette Notification dt.14.02.2000.

Area	Category of Area	Limits in dB (A), Leq	
Code		Day time	Night time
А	Industrial Area	75	70
В	Commercial Area	65	55
С	Residential Area	55	45
D	Silence Zone*	50	40

Table 11.11: Ambient Noise Standards

Solid Waste Management

In general, the main type of domestic solid waste generated from the household are food waste, Paper and polythene and waste generated from daily household activities. As the entire project area falls under urban/municipal area, almost every household uses a dust bin as the primary storage of waste and thereafter waste/garbage is being collected by the waste collector on daily basis.

Ecological Environment

Ecological resources are among the most important resources impacted by the infrastructure projects. The detailed baseline study of the ecological resources is essential to estimate the magnitude of potential impacts and to avoid or mitigate any loss caused by the proposed project.

No rare or endangered species of trees were noticed during field studies. The number of tree felling will be updated during the site clearance. For the affected trees as a compensatory measure, 1:10 trees shall be planted (as directed by the High court of Madras vide G.O no 704, dated 03/08/2010).

To minimize tree cutting it is proposed to transplant young trees to the extent possible. Local forestry officials will be consulted to transplant the trees at suitable locations.

Necessary mitigation measure will be implemented to reduce the impacts of project on overall ecology.

Socio-Economic Environment

Demography of Chennai: Chennai, along with Mumbai, Delhi and Kolkata, is one of the few Indian cities that are home to a diverse population of ethno-religious communities. According to the 2011 census Chennai then had a total population of 67,48,026 at a density of 15,840 per square kilometre spanning across an area of 426 km²; the sex

ratio was 1025 females per 1000 males and literacy rate was 90.33%. The most widely spoken languages are Tamil and English.

Utilities: The project alignment (pipeline distribution) will pass through the urban area. The alignment will cross drains, surface and utility services, viz. sewer, water mains, storm water drains, telephone cables, overhead electrical transmission lines, traffic signals and streetlights etc. As per field study, no utilities will be impacted, in case any utility will be impacted during construction phase, suitable measures will be taken care in collaboration with concerned department.

Physical Cultural Resources (PCR): No protected archaeological monuments/sites nor heritage assets are located on or along the proposed alignment. Sensitive receptors which are located within either side of the alignment, mostly are of having religious and cultural values. No sensitive receptor and PCRs will be demolished.

10.5. POTENTIAL ENVIRONMENTAL AND SOCIAL IMPACTS AND MITIGATION

During Planning and Design phase the project, construction details, materials of construction etc. ultimately decide the impacts during later phases are evaluated. Most of the impacts are occurred during construction and operation phase. While some of the construction phase impacts are temporary, others are permanent. Operation phase impacts are continuous in nature. The important criteria for identification of impact are the identification of the impact zone. For present screening studies, a direct Corridor of Impact (COI) within 500 m of pipeline distribution channel has been considered. Environmental and Social parameters are broadly classified into three groups.

- a) **Physical Environment includes** Water Resources, Water Quality, Air Quality, Noise and Land environment etc.
- b) **Biological Environment includes** Terrestrial and aquatic biodiversity and Roadside Plantation etc.
- c) **Social Environment includes** Employment, Agriculture, Housing, Culture etc.

10.5.1. Environmental & Social Impacts and Mitigation Measures

The assessment of potential environmental and social impact consists of comparing the expected changes in the environment with or without the project. The analysis predicts the nature and significance of the expected impacts. The details of potential impacts & mitigation measures are mentioned in the below table.

01		1.12: potential impacts & mi					
SI.	Parameters	Potential Impact	Mitigation Measures				
No.		-	Suggested				
1	Topography and Soil	 Cut and fill operations during pipeline laying and distribution. Borrow earth 	 The pipeline passes through mostly plain terrain and no substantial cut and fill operations are planned. Minimum cut will be ensured, and the cut material will be reused as per the suitability for backfilling. Borrow earth will be procured from approved area. IRC guidelines will be followed during excavation. Topsoil will be preserved & stockpiled properly. Borrow area redevelopment plan will be submitted prior 				
		• Quarries	 be obtained prior to operation of the same. Necessary clearance needs to be obtained prior to operation of the borrow area. Operational and government licensed quarry have been 				
			 identified, which will be used for procuring material. Pollution Control Measures should be taken care. Necessary clearance needs to be obtained prior to operation of the borrow area. 				
2	Air Environment	Generation of dust	 Sprinkling of water a. Earth handling site. b. Borrow area. c. Construction site. d. Access road route Air pollution control measures a. PPE for Workers. b. Necessary clearance needs to be obtained 				

 Table 11.12: potential impacts & mitigation measures

Sl.			Mitigation Measures
No.	Parameters	Potential Impact	Suggested
<u>No.</u>	Noise Environment	Gaseous Pollution Noise level may likely to increase during construction phase	Suggestedprior to operation of the borrow area.Regulations of construction timings near sensitive receptors and settlements.Vehicles and machineries
4	Water Environment	Drainage pattern Siltation of water bodies	 used by the workers as per requirement during construction activities. Regulation of timing of construction work generating noise pollution near the sensitive areas All the water bodies will be crossed suitably without affecting their original course and flow. Stabilizing and turfing of slopes along the water bodies (If required). Silt fencing around water bodies during construction

Sl.	D		Mitigation Measures
No.	Parameters	Potential Impact	Suggested
			 entering water body (If required) No solid/food waste will be dumped in or near the water bodies or rivers
		Flooding due to siltation of drainage channel	 Excavated earth and other construction materials should be stored away from water bodies
		Water for construction	• Water surface would be selected so that local availability is not affected.
		• Contamination from waste	 Provision of septic tanks to prevent any untreated sewage discharge from construction worker camps.
		• Contamination from fuel and waste	• Vehicle maintenance will be carried out in a confined area, away from water sources and it will be ensured that used oil or lubricants are not disposed to water courses
		• Sanitation and water use in construction camps	 Construction camp will be organized in a planned manner. Proper sanitation facilities including toilets should be provided.
			• Camps will have separate water supply facilities so that local water sources are not affected.
5	Land Environment	Loss of topsoil	• Topsoil on stripping shall be removed and stockpiled on sides to be used on the side slopes, for top cover of borrow areas and for plantation pits
		• Loss of topsoil from	• Arable lands will be avoided

	Resettlement (R & R)	• Loss of Structures and PCRs	• Proper compensation will be paid as per norms if required.

10.6. ENVIRONMENT AND SOCIAL MANAGEMENT PLAN

The environmental and social management measures shall be implemented during the various stages of the project viz: Pre-construction Stage, Construction Stage and Operational Stage. The environmental and social management plan for the project is described below.

10.6.1. Objectives

The Environmental and Social Management Plan (EMP) consists of a set of mitigation, monitoring and institutional measures to be taken during the design, construction and operational phases of the project to eliminate adverse environmental impacts, to offset them, or to reduce them to acceptable levels. The main aim of the Environmental and Social Management Plan is to ensure that the various adverse impacts are mitigated, and the positive impacts are enhanced.

Pre-Construction Stage

Prior to the contractor mobilization, the PIU will ensure that a hindrance free corridor is handed over to enable the start of project work. Clearance involves for the following activities:

- Felling and removal of trees, which should be minimal with due permission.
- Relocation of common property resources and community assets like temples, telephone poles, electric poles and hand pumps etc.
- Modification (if any), of the contract documents by the Engineer of the PMC. Pre-construction stage involves mobilisation of the contractor and the activities undertaken by the contractor pertaining to the planning of logistics and site preparation necessary for commencing construction activities. The activities include:
- Joint field verification of ESMP by the Environment Expert of the PMC and Contractor.
- Identification and selection of material sources (quarry and borrow material, water, sand etc).
- Procurement of construction equipment / machinery and other construction equipment.
- Selection, design and layout of construction areas and labour camps etc.
- Apply for and obtain all the necessary clearances/ NOC's/ consents from the agencies concerned.
- Planning traffic diversions and detours including arrangements for temporary land acquisition (if required).

Construction Stage

Activities by the Contractor:

Construction stage is the most crucial stage in terms of activities that require careful management to avoid environmental and social impacts. There are several other environmental and social issues that have been addressed as part of good engineering practices.

Activities by the PIU/PMC

The PIU/PMC shall be involved in the smooth execution of the project and assisting the contractor during this phase. Their work shall include but not limited to:

- Monitoring and guiding the contractor on adopting good environmental and engineering practices.
- Arrangement of plantation through the Forest Department.
- Arranging training to the contractor and other stakeholders according to the needs arising; and
- Implementation of Environment and Social Management Plan.
- Making changes in the design if need so arises.

Operation Stage

The operational stage involves the following activities by PIU:

- Monitoring of environmental conditions through approved monitoring agency; and
- Monitoring of operational performance of the various mitigation/enhancement measures carried out during project cycle.

10.7. STAKEHOLDER ENGAGEMENT/CONSULTATION

Public Consultations were conducted to assess the perception of the people about the proposed project. The stakeholders selected included shop keepers, residents, owners/ workers of local commercial establishments, etc. Issues and concerns of the people about the project were discussed and their perception for the same were documented.

The consultations were conducted based on the following objectives.

- > Overall features of the project and asked for the feedback of the people.
- Social and Environmental concerns.
- Suggestion to improve safety and environmental protection.

10.8. GRIEVANCE REDRESSAL MECHANISM

The Grievance Redressal Mechanism (GRM) is a formal or informal process that allows people to raise complaints or disputes and get them resolved. The GRM will be in place to redress social, environmental or any other project related grievances.

Persons having any grievances, will have the flexibility of conveying grievances/ suggestions by dropping grievance redress/suggestion forms in complaints/ suggestion boxes or through telephone hotlines at accessible locations, by e-mail, by post, or by writing in complaints register in PIU or CMWSSB offices.

Effective grievance redressal mechanism gives an opportunity to the organization to implement a set of specific measures to ensure good governance accountability and transparency in managing and mitigation of environmental and social issue of a particular project. This consists of defining the process for recording/receiving complaints and their redressal in respect of environmental and social matters.

PIU Safeguards officer will have the responsibility for timely grievance redress on safeguards for registration of grievances, related disclosure, and communication with the aggrieved party.

10.9. INSTITUTIONAL ARRANGEMENT

The Monitoring and Evaluation of the management measures envisaged are critical activities in implementation of the Project. The rationale for a reporting system is based on accountability to ensure that the measures proposed as part of the Environmental and Social Management Plan get implemented during the project cycle.

To manage and oversee implementation of the project, a dedicated State Project Management Unit (SPMU) and two Project Implementation Units (PIU) will be constituted.

Project Monitoring Cell will be set up in the PIU, which will act as the Contract Management Unit (CMU) and will be responsible for execution of the Projects.

10.9.1. Technical set up

It is proposed that an Environmental and Social Management Plan Implementation Unit (ESMP-IU) will be set up within PIU. The ESMP-IU will have an Environmental and Social Expert (ESE) who will be responsible for monitoring the implementation of the ESMP with the assistance of the Environmental and Social Safeguard Specialist of the Project Management Consultant (PMC) and the Contractor.

10.9.2. ESMP IMPLEMENTATION BUDGET

Component wise budgetary provision is provided in the ESMP report.
